That's interesting. Your hand I think is doing one of two things:

1) Changing the tuning characteristics of the antenna by "connecting"
the top half of the antenna with the lower half (i.e., via the
moisture in your hand). It would now be more closely tuned to
the aircraft range of frequencies.

2) Your hand becomes actually part of your antenna system, capacitively
coupled to it, allowing it to capture signals more strongly. I guess
you would get a similar effect if you wrapped a longer, insulated
wire around the antenna also.

I'd be interested to know what you get when you connect a wire
directly between the top and bottom halves of the fully extended
antenna, bypassing the center load.

: your scanner....

: You are incorrect.

Well, as they say on alt.folklore.urban, The World Is A Big Place.
Remember that this newsgroup is sent to thousands of sites in hundreds of
countries on every continent. What is illegal where YOU live might be
perfectly legal where I live.

Just last week a lady in Texas overheard a woman and her lover plotting
to kill her husband. She called the cops, and the plotters were
arrested. According to the police, her monitoring of the call was
perfectly legal.

In the United States it is illegal to monitor cellular phone calls; but
how on earth would you get caught? Has anyone ever been prosecuted under
this asinine law?

As a friend of mine used to say (about HBO): "If they don't want me
monitoring their signal, they can keep their radio waves out of my yard."

There is no need for a sound card as the Opto 456 handles DTMF decoding
internally. It will also decode CTCSS for you.

I have one and I use it. It does what it is advertised to do, and that is essentially to allow computer control of the RS Pro-2006. The software that is bundled with the board is *adequate*, and I expect to see better floating around in the future. Also, OptoElectronics does sell the programming details for the board, with the recommendation that the Icom CIV (memory lapse...) programming material be on hand.

Get in touch with OS regarding product and programming stuff.

9. Re: SCANNING ON PASSENGER-post flight comments

Newsgroup: rec.radio.scanner

Message-ID: <3ecive$ec@newsbf02.news.aol.com>
Source record: 263356

Since I opened up this thread I felt it appropriate to tell you all what happened on my flight. First of all, I flew United and they said that NO radios of any kind can be operated at any point while in the aircraft. However, I decided to scan through 800 mhz shortly after takeoff. I realized that i couldn't pick up anything but some silent transmissions which appeared very strong. Perhaps some bleedthrough from the aircraft's transmissions?? Anyway, I only scanned for 60 seconds during the whole flight and well, we're all alive. On my return flight home the captain had the communications patched through to the seat earphone jacks. This was very interesting and (obviously) the reception was great. Also, having some background with aviation radio helped me to understand what the heck they're talking about. It's a language all its own. -Price of these comments = 2 cents.

>John M Morrison

Look at the model number - it's in a format of: X99XXX-9999<some more
stuff>, where X=letter, 9=number. Look at -------^ this digit.

If that digit is a 3, it's a high band. If it's a 4, its a UHF.

Agreed. And one more gripe. The polarity on the LCD display is adjusted
so that the optimum view angle is from above. This is contrary to the way
everyone else does it (straight on, or slightly below).

17. Pro 51 vs pro 62 : I chose PRO-51

Newsgroup: rec.radio.scanner
Date: 1995-01-04 00:13:10 UTC
From: "P. Randy Duran" <rduran@us.oracle.com>
Message-ID: <3ecp6m$7lb@dcsun4.us.oracle.com>
Source record: 263344

julianr325@aol.com (JulianR325) wrote:
>
> Pro-62 is a better scanner with triple conversion.

I tried both the PRO-62 and the PRO-51 at the same
time to see if the triple conversion in the PRO-62 was
worth the slower scanning speed, 50ch/100freqs per second
in the PRO-51 vs. 25ch/50freqs per second in the PRO-62.

This was not a controlled test by any means, but I used
each scanner a few feet apart and programmed the same
frequencies in the same channels, then used them both.
I didn't hear any noticable difference in sound quality or
range. I used the antennas that came with each model (they
were the same). The 100% faster "Hyper Scan" of the PRO-51
really made a (nice) difference (especially with 200 channels).
Also, the design of the PRO-51 is more advanced, e.g. better
light, button placement, AIR, FIRE, MARINE, WX bands (especially
useful when you're in a temporary area, don't have the local
freqs programmed, and suddenly see a fire engine Code 3).
Frequency coverage is similar, and reducing images was not a
big deal for me.

I finally chose the PRO-51, but as I use it more and more in
my car with a mag mount antenna, I think triple conversion
might help reduce some of the interference I get. Not sure...

Did I buy the "wrong" scanner -- I don't know; but I like
the PRO-51 a lot. The PRO-62 was even on sale for $50 off the
regular price (unadvertised sale at RS), but I still chose the
PRO-51. I decided to buy it mail order from an RS distributor
in another state. It cost $257 including shipping and 4 free
Ni-Cad batteries. And I didn't pay sales tax since it was out
of state. I don't have the name or phone number of the RS
distributor with me now, but they advertise in at least one
radio magazine; try Amateur Radio or similar.

Hope this helps...

First, I cannot send you a service manual.
You didn't describe the problem in detail, but I have a couple
of hints which may help:

1) If there's an external speaker jack, make sure it is still
intact and not breaking the internal speaker connection due to
dirty or bend contacts.

2) Locate, then replace the large electrolytic capacitor in series
with the output of the audio amplifier (between amp and speaker).
The last few BC800XLTs I repaired failed for this reason.

What you are experiencing is called "picket-fencing" in the amateur radio community. It is caused when several reflected signals all arrive at the receiver at slightly different times. There is nothing that you can do to prevent it.

Okay, here are the majors that you would need for Phoenix and greater Maricopa County:

Phoenix PD: Chase 1 North: 453.100
Chase 2 Alt: 154.755
Chase 3 South: 453.450
Channel 4 South 155.370
Channel 5 Central 155.070
Channel 6 NE 155.640
Channel 7 NCent 155.520
Channel 8 West 155.430
Channel 9 N-NW 155.700
All Units use an alpha letter designator and a three digit code. The 3 digit code designates what zone they belong to.

Dept Of Public Safety/State Police

Metro Phx East 460.325
Metro Phx West 460.300
Statewide 460.225

Mesa PD: Emerg. Traffic: 155.130
Emerg. Traf. Alt. 155.535

Maricopa Cty Sheriff's Office
West Dispatch 460.050
East Dispatch 460.150
Search & Rescue 159.090
Units with MCSO use the same 3 digit type designator with an alpha letter designator.

Phoenix Fire Dept:
Dispatch: 154.190
Mesa Fire Dept:
Disptach: 154.340
Rural Metro Fire Dept:
Dispatch: 154.370

Scottsdale PD uses an 800 Mhz trunked system, so scanning it is
more of a hassle than it's worth....

Hope you enjoy, and welcome to AZ when you get here !!

Steve Yee / MCSO

In article <3eaqn1$rgm@news2.delphi.com>, KDAHLQUIST@news.delphi.com
(KDAHLQUIST@DELPHI.COM) says:
>
>Since when have you started to waste my time by advertising FirePage or
>MediaNet or whatever the service is called this month. Since you don't get
>LAFD first call (as it is generally not put over the air), why bother.
>
>I keep informed by keeping my scanner with me at all times, looking for
>Code three vehicles, helicopters and officers with lots of guns. In LA,
>who needs the additional grief? The disasters are already overreported
>anyway, mostly by your clients.
>
>Karl Dahlquist
>RCMA CA-LA-956

The majority of scanner paging nets tend to restrict dispatching any
routine first alarm items, unless it's a HAZMAT, large structure fire,
etc.

Nets such as Breaking News Network, DC Firecom, Fire Notification of
Michigan, and even Incident Command Page in Phoenix restrict pages
to at least two alarm or ones that have the potential two alarm fires.

Besides, the way that our dispatchers in AZ talk, they rattle the
calls off so fast, you need the pager to keep up with other zones...even
if your scanner is a hyper fast one....

28. Did Santa Clara (CA) PD Change Freq's?

Newsgroup: rec.radio.scanner
Date: 1995-01-04 07:57:51 UTC
From: Jeff Chung <kirby34@rahul.net>
Message-ID: <3edkdv$nuc@hustle.rahul.net>
Source record: 263336

I just started listening to my scanner at the beginning of the new
year after not having done so for about 3 months and I get the feeling that
Santa Clara PD has changed their frequencies because I haven't heard ANY
traffic whatsoever.

I still have 460.150 and 460.275 (what were channel's 1 and 2) but,
I'm not picking-up anything. I _am_ getting occasional undercover stuff
on 460.050 (channel 3), though. So, did the SCPD change freqs and, if
so, what are the new ones?

Also, I'm not picking up anything on what I had as the SCFD channel -
did they change that as well?

Thanks in advance.

Source record: 263339

It doesn't matter how many laws they have on the books, it still won't keep those who have the desire to listen from doing so, especially if they are technically inclined enough to take on the challenge.
Another thing, one would have to blame themselves if any information about themselves got out over a Cordless phone. Why? Well, first of all,nner all of the Cordless Phone manuals I've seen do warn, even in small print,er that your conversations can be picked up by receivers. If they don't then look in the Telephone book. Usually, it is listed there.
Finally, as a buyer of any sort of equipment, you should check out all features, pluses and minuses of that item. Make an Informed Decision. Then, as you will know, what can or cannot happen, or be expected. Finally, in the age of technology, nothing is really safe anymore. There are people trying to build safeguards, and there are those trying to tear them down. It's a tough battle. It appears as though there are no real winners. your
One last note: I know of one instance, where the Police had conducted a Drug Bust based on conversations they overheard from Cordless Phones. The charges stuck. uilt

Finally, please excuse me, if this doesn't turn out in a rather neat format, I'm new to some of this posting stuff.

IK>I'm new to scanning and have a BC2500xlt, I see Ramsey sells a
IK>descrambler kit and would like to know what does it descramble?
IK>Everyones help is greatly appreciated.IK>Also what are some good
scanner mags to get and maybe to subscribe to.

My personal experience with Ramsey kits, was bad. Actually, it wasn't
mine but a friend of mine. He built a kit, it didn't work. I looked it
over, I fixed a couple small things, nothing which would have caused
great harm to make it not work. A third party looked at it. We were all
in awe. We have 40 years of Electronics experience between us. The kit
was junk. When the factory was called, (kit cost about $18.00), they
wanted him to send it back and for x amount of money (not sure now of
exact amount), they would repair it. I explained the situation to the
tech. He didn't tell me anything that I didn't already now.
If they offer a complete wired and tested unit, Good Luck. If you buy a
kit, my prayers are with you. I've heard others complain of the same
problems also, so mine (should I say my friend's) isn't unique....

How come its stated that cell scanning is in the 800MHZ range when in fact I can hear cellular in the 900mhz range. Does the 800mhz range have more cellular scanning.

Also, I bought my scanner about 4 or 5 years ago does it need any modification?

Any respones would be appreciated.

Thanks,
Bob

The scanner freq list info server I setup last month has been real busy for the last few weeks. I would Like to thank you for all the lists you people send me to add. As of now we offer 40+ freq list from all over the U.S. To get an Index of whats there, email wl-scan-cj@society.com and put INDEX in the subject line. When you get the index back, to request a list just email the same address but put the keyword in the subject instead of INDEX. Thank you again and keep those lists comming :)

>and how to follow a specific service and the best equipment to use ?

I would suggest that the best equipment to use is the same make and model
as is used on the system that you want to listen to. With a letter of
authorization from the operators of the system, you can get the equipment
properly programed to follow the services you want to .

...something to think about...

I have a 2032 (which you can mod, kids), which I listen to casually. I live in a small town where most everyone knows everyone else so it is kind of fun if nothing else to "listen in". Well, anyway, I began a relationship with a cute little girl early in December. Everything was going right and things were progressing quickly (you know).

Anyway, after I met her the night after Christmas outside her work after 11 pm, we sat in my car, talked some heartfelt stuff, and fogged the windows a bit. She had to go home so I followed her back to where she turns off to head home and I went on to the house. I went in to my bedroom where my scanner is and got ready to shed some threads. Guess who was chatting away on her car phone. She was telling this married guy she was messing around with everything that had transpired between us that evening. I listened in shock and disbelief as she tore me to pieces. What a Two-Faced Psycho Hose Heifer from Hell (actually, psycho chicks are the best)!

So it turns out she is playing both of us and I couldn't deal with that. I don't know exactly how to deal with having that kind of information and I have considered getting rid of the scanner. On the other hand, this is actually information I need to know if she's just playing with me (I thought we were serious). Nonetheless, I broke it off with her that evening and we haven't seen each other since.

I guess we are only breaking into some of the ramifications of telecommunications in the hands of individuals. At what point are you "checking up" on someone? There have been incidents in the news recently of people stalking others via e-mail, can one be guilty of the same by listening to cordless or cellular calls? Where's the line? I'm angry at her, but at the same time I feel guilty for having listened to her private conversation without her knowledge. I actually apologized to her for that and the way I handled it.

So, anyway, the rule still applies: don't say or write it down if you don't want anyone else to know it. A week before she asked me, "Does that pick up car phones?"

I said, "yes". She asked, "Have you picked up me?", to which I
casually replied, "Not yet."

My opinions are probably my own. I used to be decisive, now I'm not so sure.

Pentium - When you need answers really fast, but don't care if they're right!

{{onnected Ronnie.

Hello. This is Ronnie Dobbs of the Hastings UFO Society Channeling to you by way of Madame Thelma on the Psychic CB Channel number 22, lower sideband, from an undisclosed location.

This is a SPECIAL BULLETIN.

The Hastings UFO Society is PROUD TO ANNOUNCE the Establishment of the 1st PSYCHIC CB RADIO STATION IN CYBERSPACE.

This HISTORICAL SCIENTIFIC EVENT was achieved on December 31st of 1994 when the Hastings UFO Society channeled it's report to the Internet in BREATHTAKING 8 BIT MONOPHONIC SOUND.

Two Different Locations in the Western United States have reported that they received our Psicast. Assurances that THIS IS NOT A HOAX were given by Miss Lynsa , System Administrator at teleport.com, and by Mr. Scott Doty. System Administrator at santarosa.edu. Both Miss Lynsa, who Society Member Harlan U. Blount says that he "feels" may be a "handsome woman" due to her "sensitive and womanly" use of the English language in her Death Threat to the Society, and Mr. Scott reported that the "Psychic Essence" of our Psicast apparently has altered their Hard Disks in such a way that anyone who is interested may examine the Evidence for themselves at:

ftp://ftp.teleport.com/users/lynsared/hufos

or at

ftp.santarosa.edu/pub/HUFOS

Mr. Scott also reported that a Home Page has "appeared" at his site, and was kind enough to send us a PHOTO OF THE APPARITION for us to SCIENTIFICALLY EVALUATE AND TEST for any signs of Fakery.

After viewing the PHOTO OF THE HOME PAGE APPARITION, Society Member Thyra Watson allowed as how it kind of reminded her of the "Face of Jesus that time it got stained onto that woman's dish towel."

In a Press Conference held on the front step of the Hastings Public Library, Society Spokesman Cecil Simms said that "this should be more than enough evidence to convince even the most hardened Scientific Skeptic, or even an Atheist. It certainly convinced me."

When asked as to why the Psicast was received in the Western United States, Cecil said,"The Society is at a loss to explain it at present.

Some members of the Society Think Tank say that it could be due to the Coriolis Effect, but the effects of the Psychic Sinkhole near Gainesville are not being ruled out."

Among other possible causes discussed was the possibility that some sort of trough, or pathway, or something, to the Western U.S. may have been created by the Monster Mutant File that nearly destroyed the Internet some months back. (For more information on the Monster Mutant File, please see our report entitled: PSYCHIC CB TEST CAUSES GLOBAL CRISIS)

Cecil went on to say that the reason that this idea was being discussed was because it was reported in the Palatka Daily News that a star "out there in space somewhere" was noticed by the National Observatory to have begun emitting a "bunch of xrays, or something about the time the Monster Mutant File was supposed to have hit Japan", but that it was "too early to tell if there is any correlation of significance."

The APPARITIONAL HOME PAGE, which some people are beginning to call a "MIRACLE" may be Witnessed at:

http://www.santarosa.edu/hufos/

This concludes our SPECIAL BULLETIN.

Thank You.

Ronnie Dobbs
President
Hastings UFO Society

Use Sox or Goldwin to convert from 8svx format. If using Sox, and the resulting sample is noisy, try setting the -tsb toggle.

HELPFUL HANDY HINTS

HHH #1: Our Psicast Packets are designed to stand alone so folks with small systems can take whichever one strikes their fancy, and download it without running up the phone bill too much, or tying up valuable disk space.

HHH #2: Our Psicast Packets are also designed to plug together, so if folks decide to take 2 or 3, then we suggest that they might also try and take an insert or two, as designated by the letter "i" in the filename, so as to have the satisfying radio experience of shameless advertising.

HHH #3: If you are one of the folks who are running Big Hardware, then please feel free to take as much as you like. Be sure and look for clusters of consecutive file numbers, as this will usually indicate a complete feed, or you can mix and match. All you have to do next, is to paste them together nice and tight in their numerical order, if you're going after a whole feed, and then get some coffee, or something, and listen to the Whole Thing. But we advise you that THERE ARE PEOPLE WHO DON'T WANT YOU TO HEAR THIS. So, it might be wise if listeners turn their lights off, or something, before they start, and STAY ALERT.

HHH #4: Aggressive Audiophiles might want to try taping the pasted audio onto a cassette and listen to it while driving on the highway, as Society Member Harlan U. Blount did this and reported that the Road and Wind Noise really added to the Audio Experience. Harlan also said that he thought it might be especially good real late at night.

HHH #5: If you don't have a car, or your license was taken away or something, and you can't get anybody to ride you around while you listen to our reports, then you might try taking your computer up into the attic or down in the basement, and listen to the reports there in order to get a sort of "feel" for the Spirit of Things.

HHH #6: As a Last Resort, you can try listening to our reports in places, and at times, when and where you are not supposed to.

We Hope you enjoy our Psicasts.

Thank You.

Ronnie Dobbs
President
Hastings UFO Society

While the manual is probably correct that your scanner "will not tune
within the cellular" phone band, it does NOT say you won't be
able to hear cellular phone signals. Note the distinction.

You are probably hearing what's termed an image, caused by
a natural ambiguity in the superheterodyne receiver. Manufacturers
employ bandpass filters between the antenna and succeeding stages in an
attempt to choose the proper signal but the filters are only
partially effective. Sometimes the image signals circumvent the filters
entirely by entering via the scanner's cabinet, as in the Radio Shack
PRO-2006 and early PRO-30.

There is one item I would like to add to this thread. Hopefully it does
not apply to any of us :)

I have seen a number of older HF rigs advertised at close to what they
cost new! I realize with inflation and the cost escalation of new rigs

that a good price may be a little more, but:

When someone advertises a 'Great Novice Rig' and it costs as much as it did new, a newcomer needs a good elmer to help him in purchasing the right rig at a fair price.

It does not do much for this great hobby if a newcomer finds that they paid to much for their first rig. I think in this case the price police are justified in their followup postings.

Just my thoughts.

Hi.I have a B.C.855xlt scanner and have an antenna question.
I just bought a rs discone[sp?] anteena and figured that it
would make my scanner pick up better all around.Well, i
mounted it on top of my house and everything picks up great
except chordless freqs.46-50.[Not that i would listen to
this range ;.>]
1.Why does it pick up better with the built on antenna?
2.Would any type of signal booster help?
3.Is my scanner a weak kneed wimp?
Thanx to all who respond!

: I live in Oregon where my freedom to posses a scanner in a car is still a
: freedom. If I go to a more communist/totalitarian style state where it's
: illegal to use a scanner in you car and I get pulled over while just
: passing through, what will happen to me?
It varies. In some states you'll get a ticket which will cost you
money and/or a court appearance, or the police may just confiscate
the radio, legally or not. I'd imagine that if you're from a state
where there's reciprocity, they'd stick to the ticket route since
confiscation probably isn't legal in most places. If you're from
way out of state, they may just let you off with a warning or
take the radio and assume that it's too much trouble for you to
try and get it back.

Depending on the way you drive and the kind of antenna you
have on the vehicle though, the odds of getting caught *because
of* the scanner are pretty small. So many cars have VHF and cellular
antennas these days, that even a magnetic all-band antenna looks
legal-- they look a lot like CB antennas. O f course, if you're
driving along at 90 MPH and you get nailed for that, *and* they
see the scanner...

Actually, there is little they can do legally - there is much they can do illegally.

You can beat the rap but not the ride.

1. They cannot expect you, legally to conform with their state laws if it works an undue burden on you. That is, disinstalling a radio just to drive through their state. You might just have to turn it off.
2. John Law just might want to grab it and confiscate it. Don't let hi do it. This is theft. The trouble is, "Give me your radio and I'll let you go..." is tempting when you don't want the hassle. A good defense is to see a magistrate immediately. Fight the confiscation and imply that the officer was willing to "let you go inexchange for consideration. Consideration being the radio...." This puts John Law in deep yogurt. It depends on where/when. State trooper and a magistrate with robes, okay. Deputy Cleetis A Whop and justis o da peace Marcel, probably not.
Be seeing you,
Number 6

46. Will a specific-band antenna help?

Newsgroup: rec.radio.scanner
Date: 1995-01-04 15:37:17 UTC
From: achern@io.avl.umd.edu
Message-ID: <3eefbd$s83@umd5.umd.edu>
Source record: 263359

Currently I'm using a $50 Antenna-Specialist broad-band center loaded mag mount on my car with an RS-62 scanner. I'm mostly listening to the local police frequencies, so I'm considering the possibility of adding a second antenna "tuned" specifically to these bands. The frequencies that the police in this area use are in the 492-499 MHz range. Is a second antenna worth the trouble/cost? How much improvement in reception can I expect?

Also, where could I find such an antenna? I was browsing through the Yellow Pages a couple days ago and found a place listed under "RADIO" that specialized in law-enforcement equipment. Perhaps they could find what I need, but I'm not sure if they'll sell to the general public?

Thanks for any advice.

48. scanner BBS's / Pro-62 Mods

Newsgroup: rec.radio.scanner
Date: 1995-01-04 16:33:31 UTC
From: achern@io.avl.umd.edu
Message-ID: <3eeikr$2f6@umd5.umd.edu>
Source record: 263358

I have two questions:

1) I haven't seen _any_ mention of mods or test modes for the pro-62. Is this because the scanner is relatively new, or because there is simply nothing of any interest that can be done to this scanner? I've checked all of the ftp and www sites that have been mentioned here over the past couple of weeks, but not one site had anything on the 62 (several had a mod and test-mode info for the 51, however). I checked about half a dozen of the "big" sites.

2) Several months ago someone posted a (big) list of scanner BBS numbers. Does anyone have that list? I'm looking primarily for 301/703/202 area code numbers.

Thanks for any help.

-Alex.

49. AR8000 Delay Question

Newsgroup: rec.radio.scanner

From: horak@convex.com
Message-ID: <3eej5q$31q@eugene.convex.com>
Source record: 263360

The latest Grove catalog and buyers guide, page 15, shows the programmable delay on this unit to be 1-99 seconds. I thought it was supposed to be .1-99 seconds. Would someone confirm this? I am thinking about buying one of these (not from Grove) but NOT if the minimum delay is one second. Also, is the step size programmable to 30 Khz or would I have to use a 10 KHz step to achieve proper tuning through "certain" 800 MHz band freqs? (It's a real pain to watch my Yupi MVT7100 slug through these freqs at a 10 KHz rate)

Thanks,

David Horak horak@convex.com

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993, 1994, 1995 by Bob Parnass, AJ9S |

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Introduction

The original Bearcat scanner line was manufactured by
Electra of Cumberland, Indiana. In the mid 1980s, Uniden
bought out the Bearcat scanner line and Uniden's first
Bearcat scanner was the 800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s. Electra stamped all of its scanners with a
manufacturing date code on the rear of the cabinet. The
code is comprised of a single character (C = Cumberland,
Indiana, P = Puerto Rico), followed by four digits denoting
year and week the radio was built. For example, "P8422"
denotes the radio was made in the Puerto Rico factory
during the 22nd week of 1984.

Schematics and Parts Available

Schematic diagrams may be obtained from Uniden/Bearcat's
parts department, (317)842-2483.

G & G Communications (telephone 716-768-8151) is a family
owned company which repairs scanners and stocks parts for
several older models, especially Electra/Bearcat and
Regency brands. They are located at 9247 Glenwood Drive,
LeRoy, NY 14482.

Electronic Repair Centers in Franklin Park, Illinois |
(telephone 708-455-5105) has been repairing Bearcat
scanners for several years. They charge a flat $45 repair
rate for programmable and $30 for crystal scanners, and
shipping is extra. Electronic Repair Centers will fix

Regency scanners if they can obtain the parts.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 scanners I've fixed, C98, a | capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The

22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I replaced the 22 uF capacitor in the switching power | supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate | pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two

BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Other Problems

Complaints of low audio output and occasional microphonics | in two Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Actually, it's not the typical Motorola tones, it's not a tune.. It's
more like just beep BEEP beep BEEP beep.... Last about 1.5 seconds.
But I don't understand the purpose of them, the constant computer
control on every channel screws up scanner monitoring more than the
tones! It goes off about every 10 seconds for about 4 seconds. It
might not do so when channels are busy, however.

And strangely enough, I can only find 6 channels. Perhaps they are
only transmitting the six police channels currently, and will add more
channels for other services later..

I wouldn't invest in more antennas. If you already use an external
antenna and wish to pick up local stuff, you don't need any more gain
than you already have.

To Ronnie Dobbs and his psychic CB'ers.

The Christ apparitions are a hoax!

You've been deceived by a rascally heretic from Venice Beach, CA.

This long-haired, bearded fellow has been psychicly imprinting
his facial image on dishtowels, toast, sides of houses and
TV screen for years. We've been deceived!!!

Those extraordinary feats, acheived by extreme levels of
concentration, and the purchase of UFO books, crystals,
conspiracy theory reading, loneliness, maladjustment, "In
Search Of . . . " viewing, has put this fellow in "psychic"
equilibrium with other people around the world who are just
like him!

The big tip-off to the big hoax is that, though pictures
of Christ make him look like hippies on Venice Beach, they
look nothing like people from Nazareth.

If you want to see images of Christ, look for faces like the
trio of Nobel Peace Prize winners from last year. He would
look more like that.

And if you see a hippy's face in the fog of your bathroom
mirror, or on the spots of a dog, or in your next coffee
stain, curse that psychic hippy from Venice Beach . . . .
It's the only possible explanation.

These freqs don't fit any known plan. You probably are hearing
images for your radio. Try 856 - 866 and see if you find them there.

The GE system has one continuous control channel which can be any of the
available ones. Each talk channel has a short data burst at the beginning
of a transmission. Some systems have tones afterward. The systems here all
had those removed at once; perhaps a software upgrade.

It's likely they are going trunked. Check the Police Call book since most
cties get the freqs a couple of years before they get the funding and have
equipment to test.

Daryll

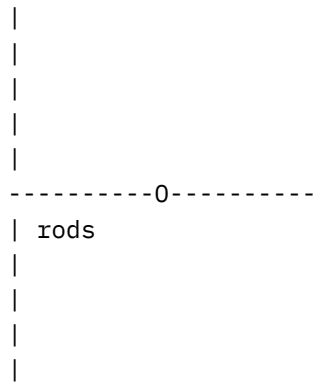
I used a crossed dipole for NOAA series VHF satellites and had a
vast improvement in signal strength. If you use a good quality
MAST HEAD FET preamplifier then you will get much better
reception...

It was some time ago that I used this and am not sure of the
dimensions but no doubt someone in the rec.ham will assist you.
I believe the crosses help with reception of the circularly
polarised signal...will have a go at drawing this for you:

```
\\ // __
\\ // /|
\\ // /
\\ // to satellite
\\ //
\\
\\ 0/\\
\\ 0// \\
\\ 0// \\
\\ 0 // \\
\\ 0 // \\
0
// \\
// \\
// \\
// \\
```

I promise I won't give up my day job!!!

The crosses are made of 12mm aluminium tubing fitted into
plastic or resin (you can make this yourself using a lid of an
aerosol can and poke the rods through small holes as below:



Lay flat on a table and balance or tape the rods to books of the appropriate type. You need to use coaxial cable loops to match the antenna impedence but I have lost the information...maybe someone else can help.

The two crosses are then space apart as in the original pic by aluminium tubing (about 30mm) through which feeder is passed.

The mast head preamp may not be necessary (as it requires power) and if you can get away without it all the better. If you need one you need a low noise fet front end amp. I'm sure these are best purchased commercially or in kit form and one for NOAA will have enough bandwidth for you up to 300Megs.

Sorry do not know full details but how that this has wet your appetite and you will be assisted by other netters with the rest.

Certainly worked very well on NOAA and I received noise free weather pictures direct on each pass in visual and IR.

Well CU later

Cheers

Jim

Anyway you point one of the crosses at the satellite and

_/ _/ _/ _/ _/ _/ Give someone 1 minute of help and
_/ _/ _/ _/ _/ _/ you'll be helped for a day in
_/ _/ _/ _/ _/ return...

59. BC 8500XLT

Newsgroup: rec.radio.scanner
Date: 1995-01-04 17:53:11 UTC
From: chris@ll.mit.edu
Message-ID: <3eena7$pag@testnews.llan>
Source record: 263367
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I am looking to buy a BC 8500XLT, could anyone give me some unbiased opinions. I know, I know, "it sucks" etc..., but Bearcat is all that we ever buy, and we are happy with the results. At a later time, I will ask for opinions about other manufacturers.

Also, if there are any mods available for this radio.

Could anyone give me the names/phone numbers for some distributors where I could get "rock bottom prices"? I had a manufacturers coupon, however at the time I could not afford it and the coupon has since expired. I have seen them anywhere from $300.00 (w/coupone) to $650.00.

Any info give will be greatly appreciated!

Chris

>they say "go to 10"? Is that another frequency and how would I find
>it, it doesn't seem to be on any lists I can find.

This refers to frequency 476.7375. It is not on a repeater and therefore you would only be able to monitor it if the party transmitting was really close to where you were. This frequency is also used for major event operations in Manhattan such as the T
imes Square detail on New Year's Eve.

E-mail me if you need anything else. Use this address though:

If I've just read the quoted text of the ban correctly, then only listening to the link from the handset to the base of the cordless phone is illegal. It looks like there is a nice little loop hole for listening to the base to handset signal. Good thing this happens to be the more interesting of the two... :)

The PRO 46 already scans some of the cell band, and can be mod'd to open up the rest. The mod description shows up in this newsgroup periodically, and I think there's a site that has all/most of the radio shack mods. I have it archived on a floppy at home somewhere, mail me (at addr BELOW) if you want it.

I own a pro-46, and it's ok, not great. the squelch is too coarse, but you get what you pay for...

70. Pro 46 Touchpad Mod

Newsgroup: rec.radio.scanner
Date: 1995-01-04 23:16:35 UTC
From: dbarton@moe.cc.emory.edu
Message-ID: <3efa8j$o9n@emoryu1.cc.emory.edu>
Source record: 263380

Greetings. Since there have been some requests lately I thought I would repost this spiffy mod for the Pro-46. This will not restore full 800 MHz coverage, but it will restore the hole b/t 868.9375, and 896.1125 with straight 30 kHz steps. All standard disclaimers apply, including but not limited to the following:

It is not legal to listen to other people's telephone conversations with radio and/or scanner equipment. This modification is provided for information purposes only, not as an attempt to encourage people to commit illegal acts. No warranty is offered, or should be implied.

PRO-46 TOUCHPAD MOD

This mod will give you access to several frequencies not in the Pro-46's normal scanning range. It will require you to erase all currently entered frequencies, so I suggest that you write them down on paper *before* you begin this process.

1. Turn off the power.
2. While holding down the 2, 9, and L/Out keys, turn the power back on.

This will erase the currently entered frequencies, and input freq.s into the first 25 memories. Of particular interest are the freq.s in the following memories:

#14: 66.450
#15: 76.825
#16: 87.425
#23: 888.96

Each of these freq.s is outside of the normal scanning range of the unit. #14 and #16 are in the TV range, #15 is in the land mobile range, and #23 is in the cellular range.

To use any of these freq.s, first store them in a monitor memory,* then once you have reprogrammed your scanner you can place them into a regular memory. You can then use the manual scan feature to search through the ranges these frequencies give you access to. You still cannot enter frequencies in these ranges manually, but any freq. stored in a monitor memory can be transferred to a regular memory. Best of luck.

*To place into a monitor memory, open the squelch all the way (so you hear static) and push one of the arrow keys. This will start the manual scan feature, but the frequency should not change because the squelch is open. You can then press the Monitor button to store the freq.

Permission is hereby granted to copy, transmit, archive, or send this file by any medium as long as it is reproduced in its entirety. Many thanks to those who submitted the info originally (sorry I lost the names).

Trident is the brand that ACE Communications started using for scanners
they had previously sold under the AOR brand name. They lost the right to
sell/distribute AOR in the US (EDCO/EEB now does).

AOR models have ranged from awful to quite good. Their quality control
tends to spotty, and (except for the recent AR8000 which is manufactured
by a different source) have obtuse ergonomics.

IMHO the biggest problem with the "Trident" brand is having to deal with
ACE Commications.

76. Mobile CB/scanner antennas, magic boxes, etc.

Newsgroup: rec.radio.scanner
Date: 1995-01-05 00:52:38 UTC
From: Dave Shaffer <DCS4@psuvm.psu.edu>
Message-ID: <95004.195238DCS4@psuvm.psu.edu>
Source record: 263419
Cross-posted to: rec.radio.cb,rec.radio.scanner

Hi folks;

Recently traded cars. The old vehicle (1989 Cavalier) had the regular AM-FM antenna, a radio shack cellular look-alike scanner antenna, and and *old* magnetic mount cb antenna on the trunk lid.

I'm thinking of retiring the old cb system anyway. The radio is an old 23 channel and leaks signal all over -- it actually interfered with the scanner on various channels -- and I rarely used it anyway. Only in a traffic jam when I was hoping to find someone near the front who could tell me what was happening...

Interestingly enough, my scanner (Bearcat 100xlt) seems to work pretty well in the new car with just the rubber duck antenna. But a handheld cb radio (radio shack trc-207, I think) I experimented with to see if it could stand in for the old cb in an emergency doesn't seem to pick up in the car *at all*. Why would that be?

Regardless, on to the magic box question. A couple of vehicles ago, I had one that had a little metal signal splitter box that allowed you to use the car antenna as a cb antenna. It wasn't as good as a stand-alone cb antenna, but it was more than adequate for listening and so-so for broadcast.

I looked in Scanner World and the Radio Shack catalogs for anything similar but came up empty. Does anybody know if anybody still makes such a device for either cb or scanner use? I kinda hate to hang auxiliary antennas all over the new car, you know?

By the way, if anybody cares, the new car is a 1993 Chevy Lumina.

Thanks for the advice! - Dave

Well, here in Britain, our Wireless & Telegraphy Act 1949, as
amended, restricts our legal listening to very little (I sha'n't
bore you with the details, but can mail them if you wish). The
'80s saw the introduction of a modified communications intercept
act, the combination of these two comprising, effectively, a
"catch-all". We are not allowed to listen to the various emergency
services, cellphones, cordless, etc., but that is but a very small
proportion of our restrictions. we are not even allowed to listen,
in the comfort of our own homes, let alone at an airfield, airshow,
etc., to the VHF civil airband!

mail me for more info/views if you wish.

Regards,
Julian.

reducing the dipole lengths by half would be almost ideal, though
given the higher downlink frequency, I'd prefer (please forgive the
concept being, strictly, erroneous) a helical "Yagi". Has anyone
used one of those "slinky" spring toys, suitably mounted?

Regards,
Julian.

Usually you can hear anything within 1-1/2 miles, of your scanner
depending on the type of antenna. These are fun at first, but often get
boring -- try the
baby monitors ~39Mhz these are fun.

Hold on for a few weeks and look at the new BC 9000XLT instead.
It is Uniden's replacement for the BC 8500XLT and has new features.

I've been testing a new BC 9000XLT and my review will appear
in a future issue of Monitoring Times.

I'd like to buy a BC 9000XLT for myself if I can find a good deal,
so that should tell you something about how I like it.

Have a like new bearcat 8500 xlt for sale. Have orig box, manuals, etc.

I had Bearcat install the latest modification boards and put in an external speaker jack.

Unit hardly used, I was original purchaser.

Am a police officer and wife hates it in my personal vehicle along with 3 two ways and cellular!

At least we agree on one point - public safety channels are *much*
more entertaining. But your point on "narrowcasting" vs "broadcasting"
leaves me curious. When I pickup my cellular phone, dial the number
of a specific person - with the intent that my conversation is
specificall for that person, the quintessential definition of
narrowcasting? As a HAM, if I pick up a mike and make a general
call to anyone listening with the intent of starting a conversation,
isn't that, in a sense, broadcasting? I *know* that many people
will be listening and, in fact intended that by transmission be
heard by as many people as possible to start the contact.

If I want to make a secure phone call, I'll use a STU III.
Just because the STU III plugs into a regular phone jack doesn't
mean that the line is *secure*. In many cases, the transmission
may go over a microwave link which can easily be intercepted
with the right equipment. (Decrypting the intercept isn't so easy!)

My point is that I believe there is a difference between privacy
and comsec (communications security). One depends on technology
for security and the other on the law for privacy. If we continue

to choose which laws we're going to obey and which we decide to break, based on our own standards, we're done for.

If we don't like the anti-cellular monitoring law, then work to change the law!

Hello everyone.

I have some Andrew 1/2 inch hardline, model FSJ4-50B. I need 2
connectors that will attach to this cable, and allow a male
pl-259 connector to be attached. Anyone have these things,
or know of a source?

Thanks.

I too was disappointed with the software that came with my OS456. Even
the demo software appears to be a mere extension of the front panel controls.
While some things are definite improvements, such as search logging, it
appears that the software designers had no real idea of how a computer
can really assist scanning. I expect there to be major advances in this
area in the next 1 or 2 years.

>enforced though).
>
My limited, over-simplified comments...

The Communications Act of 1934 says you can't repeat what you hear
unless it was broadcast to the general public or intended for you.

The Electronic Communications Privacy Act prohibited cell phone
reception and I believe now includes cordless phones.

Use of scanners can vary from jurisdiction to jurisdiction. Here in
New Jersey, it used to be a no-no to have a scanner in your car that
was capable of listenting to emergency communications without a permit.
That has been changed, due, in part, to the massive efforts of the
amateur community. A number of new ham transceivers had the ability to
scan police frequencies and radios were being confiscated and innocent
hams were being arrested. Here's The Law...

LEGALESE: New Jersey Statutes Annotated (NJSA) 2C:33-21:
"Any person who intercepts any message or transmission made on or
over any police, fire or emergency medical communications system, or
any person who is the receipient of information so intercepted, and who
uses the information obtained thereby to facilitate the commission of or
the attempt to commit a crime or a violation of any law of this State, or
uses the same in a manner which interferes with the discharge of police
operations, shall be guilty of a crime of the fourth degree".

ENGLISH: You can listen, but don't use the info to be bad or mess with
the police or we bust your butt. (A "crime of the fourth degree" is a
misdemeanor.)

LEGALESE: NJSA 2C:33-22
"Any person who, while in the course of committing or attempting to
commit a crime, including the immediate flight therefrom, possess or
controls a radio capable of receiving any message or transmission made
on or over any police, fire or emergency medical communications system,
shall be guilty of a crime of the fourth degree."

ENGLISH: If you're eluding capture by listening to us chase you, we
will bust your butt.

Interestingly, "radar devices used to monitor vehicular speed" are
specifically excluded. There i$ no $ubtantial $upporting evidence

of $ugge$tion$ from the manufacturer$ of the$e device$ that thi$
provi$ion be in$erted. ;-)

Now, ask me about Use of Remotely Activated Paging Device by a Minor...

Yes unfortunatly this has to be the dreaded Erricson/GE trunk system

We have had this sad system for three years now in Evansville, In.

It is the worse to try to monitor.

Wait till they add digital scrambling, and MDT.

Well here the GE system tones would be over rided by a key down of the mic.

We had a plane crash a few years ago and the GE system did fine on
six voice channels.

Ki4je (vhealey@crl.com) wrote:
: Are illegal to import if they are full coverage.

Well. Since you asked, I will answer... You forgot the ? at the end.

They are not illegal if they are imported for personal use in quantities not to exceed (3) per shipment and not for the purpose of resale. As a non-FCC certified device, ANY non-certified device can be imported. The device does not need to even be imported for consideration of certification or even be acceptable / ie compliant with the other regulations. Non-certified means NON-CERTIFIED or NON-CERTIFIABLE. Therefore, Atlantic in Canada can offer a money-back guarantee if your scanner does not safely arrive, and not one from Javiation has had any problem.

Obviously, you are not aware of the full coverage capability or even it's ability to be restorable easily. Believe me, nothing will stop them.
Long live international trade, to h*ll with US sales.

On the Columbus trunked system, most "tactical" stuff is indeed scrambled using DES. A good way, however, to improve your chances of hearing what you want to hear:
1. program the frequencies in descending order
2. lock out the following freqs in addition to the data channel: 859.9375, 857.4875, and 856.4875. These are normally dedicated to telephone interconnect use and are not part of the regular trunking rotation unless the system is *extremely* busy. You could prpbably get by not even programming them in at all.
3. Do not program in the frequencies that end in .7625 at all. They are dedicated to the mobile data terminal system.

Doing the following will improve you chances of hearing what you want to hear.

The number in question is not the serial number; it's the FCC ID, which is on the back. An FCC ID of 20-300 (there may be some preceding chars, I don't remember) is modifiable. An FCC ID of 20-300A is not. As someone mentioned, the FCC ID's with the A on the end is a new design, sans diodes.

Notes: MPD units who do not patrol a particular patrol district, such as those from CID, Traffic, SOD, among others, typically operate on the Citywide 1 Channel. These units often use 460.275 (if available) or 460.45 for unit to unit (tactical) conversations. SOD units remain on Citywide 1, unless working a detail on the SOD Channel. Federal users such as the US Marshals, DEA, and Crown, have been noted using Citywide 1.

Simulcasted throughout the Metrorail Tunnels and onto the VHF Band, Citywide 1 serves as MPD's emergency frequency. As in the case of the MX340-s radios, Citywide 1 is typically a channel easily selected for emergency use (all modes A through D are repeater for that reason).

The Command Channel, 460.425, routinely used by the MPD radio shop, is also the unit to unit (tactical) channel used by high ranked MPD officers bearing the coveted chrome plated MX340-S radio. The Command Channel is primarily used during special events for messages of a priority nature. Restricted use of this channel by units other than the radio shop, assures it is available for a priority conversation.

As the phase-in of the Saber continues, the 4th & 5th Districts who use 460.1 as their MX340-s Tac channel, are now given 460.45 as their Saber Tac channel. Besides being used for unit to unit (tactical) communications, the "B" Tac channels serve other purposes. Various offices, and details, such as the ROPe, SID, individual patrol district offices, and others, frequently operate on these "B" (tactical) channels.

At one time, some consideration was given to an eighth police

district on Capitol Hill. As a result, position eight on the MX340-S was allocated for this district which never materialized. Ch.A8 is currently known as the "Station Channel" since conversations between officers in the field, and the stations (or dispatchers) frequently take place here.
"D" channels are used for messages of a confidential, surveillance or personal nature by portable & mobile units only. It's not uncommon for a particular district to use its "D" channel in other districts or even in the suburbs. FCC Rules Part 90.19.(G)(3) allow for these low power, unlicensed "D" channels. Various MPD protection details, such as the Mayor's Detail, frequently operate on one of the "D" channels. The typical MX340-S (assigned to a patrol district) will only have its own "D" channel & none other. However, special capability is granted to those high level officers that possess a chrome plated MX340-S radio. The frequency commonly used by the SOD ERT units, 465.0, is actually a business paging allocation. At times, adjacent districts are simulcasted together so as to reduce the number of necessary dispatchers (Citywide 1 & 1, 2 & 3, 4 & 5, 6 & 7). See the end notes for additional MPD related material.

==========

Thanks go to the author(s) of the files and the sysop of Radio Scanner BBS.

Regards,

Alex Chernyakov.

Hello,
I will be going to a tapeing this month of the Late Show with
David Leterman. I will be staying in the midtown area of NYC. I am
having problems finding freqencies related to the show like security freqs
operations and production freqs etc. etc. I am also looking for NBC
freqs too. If you can be of any help please e-mail me.

The use of scanners on planes apparently depends on the carrier. I just returned from flying Delta from Oklahoma City to Indianapolis, and according to their rules listed in their magazine the use of scanners is permitted during the flight (except during initial takeoff and approach, taxi-ing, etc.) I only did a little bit of experimenting between Okla. City and Atlanta and was able to pick up some public service transmissions below. I also tried the weather bands, and while the main 3 frequencies were usually just noise with many undistinguishable stations on top of each other, I was also able to pick up a southern Illinois weather radio station on 162.425 (one of the lesser used frequencies) from somewhere over central Alabama, so there can be decent range at 23,000 feet.

By the way, the rules say that pacemakers are included in the group of electronic equiptment that can be used anytime during the flight. That's good to know too.

Message-ID: <1995Jan5.102308.17040@emba.uvm.edu>
Source record: 263453

I used to have an 855 xlt (just bought the pro-2035, need those channels!)
also with a rs discone.

What I did was to take off the top screw of the discone (the one that
holds on the top element), found an old telescoping antenna and inserted
a small screw and crimped them together. Then took a nut that fit that
small screw and welded that nut to the one that holds on your top element.
I had to put another nut in between those two to assure that I could
screw the whole assembly back down tight onto the discone.

Can't remember any spec.'s as to nut sizes or length of vertical assembly,
just read around a little and you'll figure out how long to make the
vertical part.

This is a pretty crude antenna but it greatly enhanced my reception below
100 mhz (the rs dicone basically "sucks" below 100 mhz.)
I sometimes have to turn back my squelch because of sooo many calls
bleeding over each other, excuse me I mean signals...

This thing, even with the small welds has held up in two terrible storms
(nor' easters)

The 855 isn't weak knee'd, your antenna is in that range

Hope this helps
Shannon

I might add that the step is programable any where from 50 hz to 999.950KHZ
just 50 hz shy of a huge one MHZ step. Who could ask for more?

I agree, at those frequencies I don't even bother with an external antenna
for RECEIVE. Transmit is a different story. You would be wasting your money.
A really good scanner should be just about able to receive a signal with just
the bnc connector at the high uhf frequencies. You don't need much.

That was the problem with designing radios that operate at those frequencies
is the ability of the signal to couple to just about anything.

People who buy into the GE system are morons. IMHO
Calculate the wear and tear on your repeater system by adding all
those 1 to 10 second manatory hangs just to play a jingle times all
the short message burst times all 16 or more channels and you get a
terrific wate of 'bandwith'. Only some government would not
think of how much resources and money were being wasted as it
comes out of someone elses pocket.

No wonder some bean counter made them take that stuff out
of an installed system.

>David Horak horak@convex.com
>Plano, Texas (not your average plain-O town :-)

The time delay when scanning memory channels after carrier drop is adjustable (in expert mode) from 0.1 to 9.9 seconds (the default is 2.0 seconds). The time delay for searching or dwell time on any active carrier or station is adjustable from 1.0 to 99.0 seconds.

The frequency step size is settable to 30.0 kHz and would be of use with European market radios (the US version is blocked for the cell frequencies).

Additional comment: My AR8000 has noticable intermodulation from ~150 MHz pagers when listening to 800 MHz public service signals. I am hoping to find a schematic for the 'front end' for possible improvements in linearity. Some expense in battery life is worth better dynamic range. I am otherwise very happy with the AR8000.

>
Scanners are legal in Canada, You can monitor anything you wish. You can not use the information for personal/financial gain. You can not divulge what you have heard. The Province of Manitoba's Highway Traffic Act does prohibit the mobile use of scanners, but there is a question of whether a Province can over rule the Canada Radiocommunications Act. I suppose you can probably use your scanner while driving through Manitoba as long as the police don't have any reason to pull you over (ie: speeding or some other traffic offence) BTW... while scanning is legal in the rest of Canada, It is not recomended that you have your scanner running if you do get stopped by police for any traffic offence. The Cop may wonder why you are listening to them, and just may find those unpaid parking tickets you have, or may just take extra time to make sure you are not hiding something (they may call it reasonable grounds)

Message-ID: <3eh971$d2e@news1.digex.net>
Source record: 263437

Many of you probably noticed that comms seems sparse in this region, especially at night. Using a Pro 2006 I entered about 200 frequencies obtained from the North East Military Communications guide for a several state wide area. Using an external scanner antenna (RS $17.95 model) the results are excellent, but still few and far between.

I recently attached a VOX tape recorder (RS CTR-476 with 1 second delay mod to save tape) and leave the scanner on all day. What a difference in results! I have squeezed about 12 hours of activity into a 1 hour tape. So far I've heard everything from air-refueling out in the Atlantic, squadrons of aircraft flying in/out of military control zones, dog fight practice maneuvers, and live weapons tests in the Aberdeen Proving grounds here in Maryland. The bulk of the tapes are still the typical not so exciting cargo aircraft checkins but so far every night yields some pleasant surprises. And of course, it seems that the activity does drop off after hours, that explains the lack of night activity (except for the local A10 Air National Guard unit doing night training using infrared, that's a post for another day!)

I hope this technique helps others who may have pre-maturely concluded that there is nothing on the mil-air bands...

Andy

Mmm ! Well I know about the opto conversion but there asking 300 uk
pounds for it ! Have loads of info on it from opto.

BUT:-

I was trying to find someone who knew of other conversions for the pro
2006.
I think it was in "Pratical Wireless" magizine some time ago,that I read

about a low cost conversion for the 2006.
All I can remember from the Artical is that they quoted the conversion as
a cheap method of computer control, and that is was compatable with SCANCAT
software.

Thanks for the suggestion!

No reason to sweat, if i remember right the phone company MUST
give you a way to block caller id on outgoing calls. My phone company
GTE says using either (*70 or something like that for each call individually)
or pay a flat rate for call block without having to prefix every call with
the block code.

To disable caller ID (in Illinois), dial *67 prior to (each) phone call.
Btw, if you get a busy signal when you dial *67 (rather than a dial tone),
then your phone switch doesn't have the ability to provide your number to
a Caller ID system.

Thats a good idea.

In the little instruction booklet that came with my Antenna Specialist antenna they say that the whip part of the antenna is factory adjusted to receive the center of the "Low-Band" (25-50 MHz). They instruct that the whip may be adjusted to favor a specific low-band frequency by removing the Ball Tip and trimming the whip. They give a good chart that shows what the exact length of the whip should be for any given frequency between 25 and 50 MHz. Suppose I wanted to "tune" the whip to, oh, say, 46 or 49 MHz or so; would this improve my reception at those frequencies a significant amount?

Hi everyone.I now have a BC 855xlt [have had for about 6 months]
and now i have the fever for a better unit.Naturally i want one
that is cell. capable so im going to try something from Atlantic
Ham Radio out of Canada which leads me to a few questions:
1.Has anyone had experiences with AHR?[good or bad]
2.What is the best scanner for the price[under 500.00]
3.Should a more expensive scanner pick up better than my 855
[range doesnt seem very good below 100 mhz]
4.ARE the units coming from Canada still full 800mhz?
Tanks to all who reply!

Yeah, but they don't know your phone number when they do that. I recently
made a call, but used the wrong area code, so I hung up after one ring.
Then, my phone rang and it was the person I just called, incorrectly.
Ha Ha, the jokes on them because they just made a long distance call
to somebody they didn't even know.

Phone companies heck. I have a software switch right here on my
desk that rejects caller id. blocked calls when set.
I can also set upto 100 numbers I want to be rejected by the second
ring. They get a nice voice that says their call will not be accepted
currently. Great for zapping anoying businesses that will not take
no for an answer. It is all part of a high tech caller id unit
I bought for $90 from Beltronics.

> mentioned, the FCC ID's with the A on the end is a new design, sans diodes.

What if the PRECEDING characters are AA? I'd like to do the D6 diode mod
but want to know (for certain)...

IS a PRO-39, FCC ID: AAO20-303, SN: 098625 modifiable or not?

I've got the other mods from Monitoring Times Jan. 93:

D6 restores 869-894 MHz coverage
D4 enables 68-88 MHz coverage, but deletes 30-54 MHz
D5 (present) allows 800 MHz band operation
D7 makes cellular spacing 12.5 kHz (incorrect)

Are there any other mods worth doing to a PRO-39?

Thanks in advance!

141. AR8000 Information wanted (ar3000 also)

Newsgroup: rec.radio.scanner
Date: 1995-01-05 22:15:22 UTC
From: Ki4je <vhealey@crl.com>
Message-ID: <3ehr1q$8qi@nntp.crl.com>
Source record: 263298
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.shortwave

Updating an expanding the ar8000 homepage and I need
to know if anyone has found any new tricks tips or shortcuts
to using the ar8000.

I would also like preformated lists of frequency /data
that others can quickly download and then upload
directly into the radio with any term program.

HF lists and mil frequencies that are universal may
see alot of action. remeber to set the mode correctly.
Load your scanning receiver then dump it to a file
as an ascii capture. Others can reload the identical
information in a heartbeat to try out.

Full credit given to sources.

Who has found the ar8000 by other vendors other then
Jonathan? You feelings toward them? I still favor
Javaition but I realize some are uncomfortable
with buying from Europe. Lets have a page
comparing sources as information for others.

A review of the US interface so others can compare the difference
between it and a full featured one from Europe.

Any suitable gifs that relate to the ar8000, scanning, vhf, hf
radios or radio stations.

It reaches the repeater, it just doesn't get repeated. The repeater is
much more tightly tuned and sensitive to signals than you and your car
antenna. If you're far away from them in "B" mode, you won't hear them
very well. You could try to get a better antenna tuned to their freq.
(maybe a 5/8 wave) or put a yagi on your car :-) but if it was me, I'd
try to find a central location on a hill or get closer to the action.

)Best regards,
) __________
)-----------Scott C. Savett------------------------------\ ________\

I'll go beyond that. It is not -receivers- which are banned, it is
transmitters (in certain frequency ranges). But heterodyne and
superheterodyne receivers (as well as mis-adjusted regens and
superregens) are -also- transmitters. This is what causes
interference. There is nothing illegal about a TRF receiver on ANY band
(WRT use on an aircraft as opposed to anywhere else).

If you have a TRF type receiver (i.e. non-oscillatory) then you may
operate it (so long as the receiver itself is legal under other
circumstances, no Cellular Phone TRFs).

>3.Is my scanner a weak kneed wimp?
>Thanx to all who respond!

The Radio Shack (or any well made) discone is a *great* scanner antenna (I have the RS version myself) It is a *very* wide range, fairly flat response antenna. However, the cordless freq band is actually *outside* the freq range of the antenna. It does receive that band, only because any piece of metal will recieve any freq range (but not necessarily very well) Some versions of the discone (I think Icom and Diamond) have a low freq whip sticking up out of the center of the "disk" to enhance low freq reception.

> Is there a newer/better model available now?

I have the new Uniden/Bearcat BC3000XLT, a replacement for the
the BC2500XLT, on loan for evaluation. Although I've not
completed testing, I'm pretty impressed with what I've seen
so far and I haven't experienced the overload problems
which dogged the earlier BC2500XLT.

I've been told the street price will be near the Damark figure you
quoted for the old model and they are expected to become
available in a few weeks.

154. map of transmitters in your town or neighborhood

Newsgroup: rec.radio.scanner
Date: 1995-01-06 02:29:13 UTC
From: parnass@nwsf.ih.att.com
Message-ID: <D1ypKp.5sG@nntpa.cb.att.com>
Source record: 263470
Cross-posted to: rec.radio.swap,rec.radio.scanner,alt.radio.scanner,rec.radio.amateur.misc

Want to "see" where the transmitters are located in
your town or neighborhood? Find the source of that
rotten intermod interfering with your repeater or scanner?

From the rec.radio.scanner FAQ article:

Over 15% of the FCC licenses, including many fast food
restaurants, contain transmitter latitude and longitude but
specify no transmitter city. To determine the location of
those transmitters requires using the latitude and
longitude information.

As I have already done for dozens of radio enthusiasts in
several states, I will locate FCC licensed and selected FAA
transmitter sites in an area of your choice, and produce a
custom color map. I call this new innovation RadioMap(TM)
service. It allows you to identify antenna sites
(including paging and cellular phone cell sites) and
visualize the transmitter locations in your neighborhood,
near your office, at an airport, and other places of
interest -- from VLF through microwave.

This is completely different from the limited maps
displayed on the Grove Enterprises CDROM. Through a new
licensing arrangement with a professional mapping company,
RadioMap shows detailed streets, railroads, rivers, and
cities. Ham radio stations are not shown as they would
clutter the RadioMap. RadioMap includes key sheets which
list frequencies, callsigns, and licensee names. In rural
areas, ranges of up to 10 miles are possible, while ranges
of 1/2 to 3 miles produce best results in urban cities.

I will produce custom color 8-1/2" by 11" RadioMap reports,
suitable for framing or laminating, for areas in any of the
50 states. Send $19.95 for each color RadioMap, your name,
address, and telephone number, along with center location
(nearest intersection of 2 streets, or latitude &
longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL
60543. tel. 708-554-3839 6-10 PM central time.

NOTE: please don't send e-mail to this account but feel
free to phone me at 708-554-3839 evenings if you have
a question.

: I live in Oregon where my freedom to posses a scanner in a car is still a
: freedom. If I go to a more communist/totalitarian style state where it's
: illegal to use a scanner in you car and I get pulled over while just
: passing through, what will happen to me?

If you are lucky you'll just get a warning and sent on your
way. From that simple interaction you could have the scanner
confiscated as evidence, you might be arrested, etc.

Bottom line is that you are supposed to obey the law(s) of
the state that you are in. Best bet is to not risk an encounter
by knowing which states are potential problems...OR get an
amateur radio license because each of the few states that actually
forbid scanners in automobiles all have an exemption for
amateur radio operators.

: if nothing else to "listen in". Well, anyway, I began a relationship with a
: cute little girl early in December. Everything was going right and things
: were progressing quickly (you know).

: Anyway, after I met her the night after Christmas outside her work after 11
: pm, we sat in my car, talked some heartfelt stuff, and fogged the windows a
: bit. She had to go home so I followed her back to where she turns off to head
: home and I went on to the house. I went in to my bedroom where my scanner is
: and got ready to shed some threads. Guess who was chatting away on her car
: phone. She was telling this married guy she was messing around with
: everything that had transpired between us that evening. I listened in shock
: and disbelief as she tore me to pieces. What a Two-Faced Psycho Hose Heifer
: from Hell (actually, psycho chicks are the best)!

: So it turns out she is playing both of us and I couldn't deal with that. I
: don't know exactly how to deal with having that kind of information and I have
: considered getting rid of the scanner. On the other hand, this is actually
: information I need to know if she's just playing with me (I thought we were
: serious). Nonetheless, I broke it off with her that evening and we haven't
: seen each other since.

Well, I think it was better for you to get rid of her than your scanner
for a few reasons:

1) You now know that she was playing with you, so you should get made at
her, not your scanner.

2) She knew you could listen to her, so she was either playing playing
you because she thought you may be listening; or she may actually have
been playing you. Who knows?

3) You weren't intentionally listening to HER, I trust your scanner
was on either limit search or channel search, so you had no idea what
you'd pick up. Thus, it was coincidental, and it would be the same (I'm
not saying this would happen) as hearing about it from this guy she was
talking to.

My opinions.

^^^^^^^^^^^^^^^^^^^

Ah, I think "second ring" is the key phrase here. I'm not trying to support the phone companies, but I wouldn't like having to hear those two rings. I would imagine that it might become annoying having to wait for the third ring to see if the call is "acceptable". Maybe I'm missing something. If, however, the CLID unit has the option of holding the ringing _until_ the third ring then this problem would be nullified; except, of course, for the other phones on the line that aren't connected to the CLID unit.

On the other hand, this WHOLE problem could be avoided by hiding your number from CLID boxes by dialing through the operator.

Regards,

Alex.

c > >

Wronggg! I have tried that, we have our line blocked here.. we
called a friend, then they tried the old *69.. they got a message
from the phone company, but not my number. They were given the
option to call me back... but that doesn't matter much they still
don't know the number. :-)

>specificall for that person, the quintessential definition of
>narrowcasting?

Because the Cellular and the Cordless phones don't send the signal to the other phone or even to the base, they send it in a 360 degree by 360 degree sphiere (disregarding horizontal v.s vertical polization and antenna patterns an such). In other words it sends it to everyone withing range (which depends on the senitivity of the reciever). You are not just talking to your base, you are talking to everyone, but hopefully only your base is listening.

> As a HAM, if I pick up a mike and make a general
>call to anyone listening with the intent of starting a conversation,
>isn't that, in a sense, broadcasting? I *know* that many people
>will be listening and, in fact intended that by transmission be
>heard by as many people as possible to start the contact.

That is broadcasting, but If you were calling for a certain Operator who you knew would be on that frequecy , your call and subsequent conversation is still a broadcast. It is very likely that other hams will be monitoring and people like me are likely monitoring with our scanners (ham bands are interesting).

If you wanted to not broadcast you would need to do point to point transmission. At least all my RF and Microwave classes have given me this impression/opinion.

>If I want to make a secure phone call, I'll use a STU III.
>Just because the STU III plugs into a regular phone jack doesn't
>mean that the line is *secure*. In many cases, the transmission
>may go over a microwave link which can easily be intercepted
>with the right equipment. (Decrypting the intercept isn't so easy!)

Microwave signal because of the way they are transmitted are not broadcast. They usually have less than a 5 degree wide beam and are not transmitted through houses, but instead over them. You are definately right, no communication medium is absolutely secure, but with wired phone calles (even going over microwave links), the user has a reasonable expectation of

security. Phone calls going over satellite add an even greater layer of complexity, because they are broadcasts.

>My point is that I believe there is a difference between privacy
>and comsec (communications security). One depends on technology
>for security and the other on the law for privacy. If we continue
>to choose which laws we're going to obey and which we decide to
>break, based on our own standards, we're done for.

Everyone chooses which laws to obey everyday. I drive my car at 65MPH every work day. I jay walk on my way from my car to my work. And I prabably break several other minor laws and don't even realize it. I had a conversation with a pheonix police officer (DST) on IRC the other day, in which I mentioned the more stupid laws we have the less respect all laws (including the good ones) will get.

>If we don't like the anti-cellular monitoring law, then work to
>change the law!

I really don't care enough to do anything about it. I don't like (what I feel is) my rights being infrindged upon, but on the other hand cellular and cordless isn't usually that interesting to start with an I would prabably never get cought even if I did want to monitor.

168. A well-designed scanner

Newsgroup: rec.radio.scanner
Date: 1995-01-06 07:47:39 UTC
From: achern@jupiter.avl.umd.edu
Message-ID: <3eisir$2hf@umd5.umd.edu>
Source record: 263285

I'm looking for a handheld scanner that has some "luxury" features, but without too many of the options I would never use. Important features that I'm looking for (in no particular order):

1) Handheld
2) Triple conversion
3) Adjustable delay time
4) Selectable Scan (such as that of the AOR8000)
5) Alpha-numeric display
6) Ability to switch display light to _stay_ on

There are others, but you get the idea. None of the Radio Shack scanners offer anything with features #4,#5,#6, or even #3 if I remember correctly.

I'm looking for something more advanced than the PRO-43,51,62 but not so decked out as the AOR8000. I'm very familiar with computers/radio technology, and I am _capable_ of using the advanced features of the AOR8000, but the $600 price tag is restrictive. Would it be reasonably possible to find the AOR8000 used for something in the $400-$500 range?

Thanks for any advice.

-Alex.

Digital TDMA cellular phone transmissions are a very tough and complex signal to intercept as well as
not a legal thing to do if you could. The main problem is that right now there are 3 conversations on one
rf carrier. 3 mobiles out there pulsing data at just the right time so that it arrives at the base station in the
right time slot. The system talkes to the mobiles to time align to keep the data in sync or they would all
just squash each other. The reason that timing is important is because the mobiles are all different
distances from the base antennas, so it takes longer or shorter depending on who is where. TDMA =
time division multiple access. Don't hold you breath for anything out there to pluck signals off the air, its
a much more complex game out there now. Even the feds have problems now.

If it sounds like "swish swish swish" and then a woodpecker at four ticks
per second then I suggest that it is Digital Voice Protection (Motorola)
ran through TWO units. One sounds like a modem with a whine at the end,
I suggest that this "NEW" unit is simply TWO DVP's together in series.
The woodpecker sound gave it away for me, I figured out that was what
the whine would sound like if encrypted at the data rate used considering
the whines frequency.

Anyone else ?

Motorola maybe ?

I saw what looks like a big price cut on these radios in
a shortwave magazine from Engalnd. You may want to
check on new price from Javaition etc. They may have
been trying to blow them out for xmas. I am not certain if Javaiton had them
on sale but others in the same magazine did.

May I suggest forwarding this query to Jonathan Cloug of
Javiation. The range and depth of scanners available outside of this
country is mind boggling. There may be one that fits the bill.

What is confusing is that some of these boxs are merely
slightly repackaged versions of some of the very products
even seen at radio shack. I don't believe bearcat sells
anything of significance outside the usa.
That may tell an observer something.

Hey Rick, someone *69'ed you from another area code? Interesting because in the 703
area code, (Northern Virginia) *69 doesn't get me out of the local area.

To all the other posters on this thread - don't worry about whether the girl has caller
ID when you play the tape recording into her answering machine - do it from a pay phone!

: are arriving at your antenna at different times as you drive.

: The various signals combine and constructively and destructively
: depending on where you are, and that (of course) changes as you
: move ==> the resultant signal strength varies.

Perhaps some sort of diversity reception would help--using an array
of antennas and choosing the best signal.

Also, it may not be intuitively obvious that the choppiness is the
result of the signal fading in and out of the noise level. This
is how FM, frequency modulation, typically reacts to weak signals.
If you think about it, the signal disappearing is a big change in
frequency--thus a lot of modulation.

Joseph Covello asks about the GRE Superconverter ICOM/combo.

I had a Superconverter, which I used very successfully with my
old Pro2021 (I have sinced traded up to a Pro2006). The
combination worked great for me. Of course, you have to remember
that in order to get the 800 freq's you have to 'punch in' the
400-912MHz frequences on your scanner, and that while the GREhat
is on, your scanner cannot receive BOTH the 400 and the 800
freqs at the same time. Which was one reason why I sold the GRE.
Personally, I think the GRE/Icom package, even if the combo
price is good, doesn't make that much sense while the Pro2006
is still available (and modifiable).

>chat.

The tone board for the BC 8500XLT (and a few other models) is to allow you to use CTCSS (Continuous Tone Code Squelch System) a.k.a PL. This allows you to only hear the transmission you want. This assumes that the transmissions contain the tone to begin with. This has nothing to do with speech scrambling. The CTCSS to is a sub-audible tone that is sent with the transmission. The receiving radio will only open squelch if the correct tone is present.

185. PRO-39 user manual needed?!

Newsgroup: rec.radio.scanner
Date: 1995-01-06 15:32:08 UTC
From: koi@uncledad.nwscc.sea06.navy.mil
Message-ID: <9501061532.AA28338@uncledad.nwscc.sea06.navy.mil>
Source record: 263302

I purchased a PRO-39 and it came with no manual. Is a softcopy available
for this model or similar Radio Shack Models (w/hyperscan). Or should
RS be the best approach?

Thanks
koi@uncledad.nwscc.sea06.navy.mil

186. OptoScan 456 availability

Newsgroup: rec.radio.scanner

Just curious if anyone knows of a good place from which to order
the OptoScan 456. Grove has them on backorder for about 2 weeks and if
you order directly from Optoelectronics the cost is $299.00.
(about $20.00 more than that of Grove).

Many thanks,
Joe Retzer

It's the reason Grove stopped carrying the AOR line :-)

Ya know, I was thinking about that. I'm thinking (now) that what I did
was I failed to use the area code on my incorrect call thereby getting
someone in the same area code. Anyway, I still think this option of calling
back someone when you don't even know who/what they are is silly.

As for the original thread, I agree, lose the girl and keep the scanner ;-).

When we viewed a launch we took a portable TV with analog VHF/UHF
tuning. Around ch.14 UHF (or it could have been ch.13 VHF) we
found a local, low power station. It included NASA programming
of video and audio not carried by the networks. It included
pilot breifings, weather reports, communication links with
Houston, reasons for holds the networks weren't carrying, etc.

Have fun,
de Dick, N0USP

I was wondering if anyone out there happened to have the freq for
a local security company here in Atlanta.
They are ARKO Executive Services and have STANDARD(brand) HT's
with small 3inch stubby antennas.
If you have them listed in a database or know of a freq i could
try let me know.
thanx

Sony 2010 - 3

I found it VERY easy to plug in and start listening. The supplied instructions are adequate for what they do, but are not really enough to really start enjoying the radio. The whip antenna works great at home, but just doesn't cut it at work (way too much metal/interference). Even the supplied wire antenna does not seem to help at work (I have not yet tried it at home (no real need).

****
Realistic DX-342 - 1

I've owned this little radio for about a year now and am really pretty happy with it.

Advantages: Size - Measuring approximately 4 3/4 x 2 5/8 x 1, you can take this little mini anywhere! Even slip it into your shirt pocket!
SW bands - Covers 9 SW bands: 49m, 41m, 31m, 25m, 21m, 19m and 16m.
MW, FM, FM Stereo (thru headphones)
Travel Power lock
Push button control
Runs on two AA batteries or AC adapter
Travel pouch
Carrying strap

Disadvantages: It's an analog unit, guys and gals, no digital display.
No back stand
Antenna does not rotate up

I've had a lot of fun with this little receiver. The SW sensitivity is quite good for my area of the country, Cleveland, Ohio. The speaker has a nice sound and improves thru the earphones. FM stereo thru headphones is great! MW DXing is surprisingly good! I can grab signals from Boston, Chicago, New York and Cincinnati much better than on my Magnavox AE 3625 Digital!

Summary: A nice little travel radio that's fun to fiddle with or take for travel when you're in a pinch. Radio Shack has discontinued this model so you might be able to find it on sale for around $50.00. I love the size! Ideal for travel! I'm

beginning to think that anything larger is too
cumbersome. I do miss the Digital Display and all the
features that go with it: Freq. display, Alarms,
world time display, etc. If I were buying today, though,
I'd consider what else is out there for just a bit more
money. For example, the new Sangean 606 is only
slightly larger and has all the digital features mentioned above that I miss. I
've seen it priced for as little as
$179.95!

****
Realistic DX-350 - 1

I bought this radio when I first started out in shortwave listening
because it was the cheapest thing at Radio Shack. I think I paid $60
for, but I'm pretty sure the price has gone down since then.

Nowadays I mostly use it as my travel radio. Sesnitivity is okay for the
price, but not too great. When I'm at home (western US) I can pick up
the major international broadcasters, but no too much else. On my trips
back East, I've found sensitivity picks up some, but it's still only
fair.

Performance on the AM and FM bands is average, but longwave seems to be
nearly useless. I've never heard any nav beacons on this one, even
though there are several near my house.

Radio Shack sells a reel antenna for about $8, and I picked one of these
up when I bought my radio. It helps reception a little, but not very
much. A much better solution is to wrap a stripped end of a wire around
the the whip antenna, and attach the other end to a metal windowframe.
I've tried connecting my longwire to it, but that just overloads the
receiver (not surprising).

One major problem that I've noted is that the dial markings on some
shortwave bands seem to be off by up to 10 kHz. If you know about it,
it's not much of a problem to work around, but initially it could be
quite confusing.

Overall, this receiver is average for its price. There's no real
surprises, either good or bad. If you really want an inexpensive radio,
go for this one. Otherwise, I would advise saving your money and going
for an inexpensive digital radio.

****
Realistic DX-375 - 1

It costs $99.99 though I got it for $89 since I had a coupon for a
rebate. For the price I think I got a good deal. It has digital tuning
and direct input of frequencies which allows tuning to be a pretty
simple job and not a time consuming act of patience. It uses two C type
batteries... I use rechargable ones and they last a pretty long time..

It is not small enough to carry in your shirt pocket but it could fit in the front or side pocket of an average sized backpack. It is just great when you are walking back home from school/work ... it can be easily carried in one hand as you catch up on the news from BBC/Deutschewelle/Radio Australia/etc.... as you walk home..
I get decent reception of all the `big stations' even indoors and have, on occasion also been able to tune to Radio UAE....

The sleep function is perfect for someone like me who likes to fall asleep with music... the FM sound is pretty good in stereo (headphones)... The AM reception is also fairly good but it has a very high tendency to catch those Bible bashing stations...probably a reflection of the region where I live...

The strap is a little shoddy and I have a feeling I may have to `fix it' soon... I expect it to pop out any moment....
Despite that, I like it...

****
Realistic DX-380 -2

I've owned a DX-380 for about 9 months now and....
It's a GREAT RADIO! However, I should qualify this. I bought it on sale from Radio Shack for the bargain price of $129.95! It regularly retails for $179.95. At $130.00, this radio is a real steal!

About the size of a large paperback book, the 380 is feature packed!

*DUAL CLOCKS
*ALARM WITH RADIO/BUZZER
*60 MINUTE SLEEP TIMER
*DUAL BANDWIDTHS
*DIRECT FREQ. ENTRY TUNING
*TUNING KNOB
*SLEW TUNING
*TUNES IN 1 OR 5 KHZ STEPS
*CLOCK DISPLAYED SEPARATELY
*BACKSTAND
*STEREO THRU HEADPHONES
*CONTINUOUS SW COVERAGE...NO GAPS!
*AUTO SCAN UP OR DOWN
*ANTENNA ROTATES AND SWIVELS
*CARRYING CASE

The sensitivity of this radio is GREAT! With a reel antenna, it's even better! I read another review that said reception was lousy....I think that individual should check his particular receiver as he might have the rare defective unit. MW reception is also outstanding and with a Slect-A-Tenna is greatly improved! Herein Cleveland, I pick up Chicago, Cincinnati, and Pittsburgh during the day WITHOUT the select-a-tenna! With the S-A-T reception gets an added boost!

(these are all 50,000 watt stations)

I have found it to be about the perfect travel size. I would like something smaller, like the 606. This size, however is fine. I've carried hardbound books on jets that are larger. The many features makes up for it's slightly larger size over a mini. It does not have SSB, but I really don't miss it.

All in all, A great radio priced at $130.00! I would not have bought it for the price of $179.95. There are other radios in that price range that ive ya more bang for the buck. At $130.00, it's a great deal! If you can get it at that price, snap it up!

I am by no means an expert, but I have a DX-380 and can give some of my experiences. First of all, I would pay the extra to get the 390 to get the single side band capability. I miss it. I miss it. Also, the sensitivity for foreign broadcasts (I'm in DC) without an external antenna is poor. You get the BBC and some German broadcast relays from Canada transmitters, some south american stuff, and that's it. BUT with a 50 m Cu wire out my 2nd story window attached to the antenna with an alligator clip, I regularly get Abu Dhabi and Australia at night.

****
Realistic DX-390 - 2

Great mid-sized digital portable. Good sensitivity and selectivity. Digital display shows time, frequency, signal strength, and memory location. Covers LW (in 9 kHz steps), MW (in 9 or 10 kHz steps) and SW continuously from 150 kHz to 30000 kHz. FM reception (88-108 MHz) with stereo through headphone jack. BFO control for SSB reception. Built-in timer/clock, 9 programmable memory locations per band, except 18 on SW. Good audio output. RF Gain and AM bandwidth controls. Keypad frequency entry. External antenna, AC-adapter inputs.

A great radio for the beginner or as an upgrade from a smaller and/or analog unit.

Purchased from Radio Shack for $219 in January, 1992.

I have a new Realistic DX-390 (alias Sangean 813??). Seems to be a great value for the price $169 US. I haven't yet heard from someone who can recommend a radio for the same price that is better, and can back it up with facts.

****
Grundig Satellit 700 - 3

Truly a world-class portable, digital receiver. Excellent sensitivity and selectivity. Digital display with two separate clock/timers, signal strength meter, band selection, frequency readout, and user-definable eight-character "name" for each

memorized station. Has RDS circuitry on FM to decode the newly-phased-in system for identifying stations by call letters, format, etc. 512 memory positions, upgradable to 2048. Tunes in .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. Receives USB and LSB. Synchonous detector helps pick difficult-to-receive stations out of the crowd. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz). Excellent audio output, with separate treble and bass controls. Stereo through headphones or external speakers. Line-level out (left and right), external antenna, and 12 VDC-in jacks. Local/DX switch. Built extremely rugged. Multi-national power supply included.

An outstanding performer, and worth the price to a serious SWL or DX'er who requires portability.

Purchased from Universal Radio for $479 in April, 1993.

The Following is a comparison of the SONY ICF-SW77 and the GRUNDIG SATELLIT 700:

Both of the receivers you are looking at are pretty solid. The Sony is slightly smaller and has a somewhat more "finished" feel about it. The Grundig is SOLID with a much better sound. Neither is as good a SW signal receiver as the previous Sony, the '2010 (2001). However, they both have very advanced features; multiple (and in the Grundigs case, expandable) memories with alphanumeric tags so that you have a name as well as a frequency, all sorts of memory grouping and scanning etc. The Grundig has good RDS ident. on it's FM band, but I have a feeling that this isn't used much, if at all, in the US. If you intend to buy second-hand, be very wary of the SW77 - the early version was pretty flakey. The later version is better but still not as good as the '2010.
I think that the choice comes down to "feel". They are both quite complex to use, but both work as advertised. Try 'em both as they have quite distinct operational methods. If sheer performance on SW is the main point for you, compare them with the Sony ICF2010. You'll buy it and save some loot !
For what it's worth, I tried them both and settled on the Grundig. I have my Satellit 700 in daily use and it's performed without a hitch.

My reasons for the choice were:

1. Performance. The Grudig was much better than the early SW77.
2. Sound. I happen to prefer the slightly bassy Grundig sound to the somewhat sharper Sony.
3. Power. The Grundig takes D cells and can self-charge Nicads in the set, which is how I have it set up. (The SW77 used C cells)

They both run down batteries fast. The Sony worse than the Grundig due to it's smaller cells.
4. RDS. I love it and the SW77 doesn't have it.
5. Feel. I like the, I don't know, Germanic solidity and sheer heft of the Satellit. A Satellit with a full load of 4AH Nicads can tip the scales at twice the weight of a SW77. Of course, if drop one on your foot the Sony would be the better bet ! I only use the Grudig about the house. I have a '2010 for the road.

I hope this splurge hasn't clouded the issue for you.

Editor's Note:
I have one of these radios and love it! I sent the following message to someone just after I bought it.

I just recently forked out $500 and bought a Grundig Satalit 700. The sound from the radio is truely impressive! I have always wondered why broadcasters put music on shortwave, because it alway sounded like garbage. However with the 700 I can listen and enjoy the music. The 700 has Bass and Treble controls, which improve the sound quality but the Automatic Gain Control most likely does the most toward improving the sound (I'm not an expert, so this is just a guess!). Anyway my Wife regularly listens to music coming from a 60m band radio station in Guatemala, and can enjoy the sound. However there are some bad points. It is programable, but I have not worked out how to do it yet. Well I tried once and gave up. This is not too bad though, because BBC, Deutche Welle, and about 10 others are stored in a ROM table. And these frequences actual work (i.e. they are the frequencies for North America and NOT Germany).
Also I connected a long wire antenna and found my local AM station on shortwave. I guess the front-end is not good enough to sort the signals out when coming from a large antenna. But don't worry about this either.
If you only want to listen to the biggies like BBC, Deutche Welle, you won't need an external antenna. I am planning to put a Pre-selector between The Radio and the Antenna, and I think this will cure the problem of AM stations on shortwave and cut out some interference. Finally I recommend this radio to you. I'm sure you will have hours if enjoyment from it.

****
Grundig Satellit 500 - 2

Formerly Grundig's flagship portable SW receiver, this is still an excellent piece of equipment. Excellent sensitivity and selectivity. Digital display with two separate clocks (only one displayed at a time), signal strength meter, frequency readout, and four-character user-definable "name" for each memorized station. 42 memory positions. Tunes to .1 kHz

increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. In addition to AM, has three receiving "modes" for LW, MW, and SW: USB, LSB, and "Sync," which should more accurately be described as "fine tuning," as this implementation of synchronous detection operates differently from the Satellit 700 or Sony 2010. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz).
Excellent audio output, with separate treble and bass controls. Stereo through headphones. Line-level out (mono), external antenna, and 12 VDC-in jacks. Local/DX switch.
Built extremely rugged. Power supply included.

An all-around great performer. Now that it's discontinued, many outlets are selling this unit at close-out prices, making this radio an excellent value for the money.

Purchased from Universal Radio for $379 in December, 1992.

I have a Grundig Satellit 500 and am basically satisfied with it. I miss the 512 memories of 700 and 'SSB clarify' control sometimes.

Yes, its 'sync' is exactly fine tuning in 100 Hz steps. However, it is rather simple to make it work similarly to '700 and '2010, because the detector chip is the same in all three. Only a switch with two pairs of contacts is needed. Another design fault, the excessive distortion in SSB mode, can be partly cured by adding two resistors. For serious DX-ers it may be important that the internal ferrite rod cannot be disabled on MW and LW in both 500 and 700, so the in-house noise may become a problem on these bands.

****
Lowe HF-150 - 1

The Lowe HF-150 (sold by Universal and EEB) is a nice compromise. Similar number of cubic inches as the Sony (different shape), but offering some features of the R8. Also the Lowe is made with a mostly solid alumnum case, which is better than the Sony or the Drake. The Lowe has dual antenna inputs (wire or SO-239), record out, audio out, 12vDC in. It can run off any 12V DC battery.
I use 7 aH gelcells which I recharge. The Lowe also takes 8 internal AA nicads *OR* disposable batteries. It will recharge the nicads with a builtin recharger if you plug it into an external power supply. It's a nice semi-portable radio. It has a few ideosyncracies, but you might want to look at it.

****
Lowe HF-225 - 2

I've had an HF-225 for a few years now, and I'm pretty happy with it. I use it mainly for broadcast listening. It's connected to 25m of random wire via a 5m coax run inside the house.

I tried using an ATU to improve the matching between the aerial and the coax, and on some frequencies it gave a (small) improvement in signal strength, but it was such a pain to keep retuning that I gave up using it.

I recently bought a "magnetic longwire balun", and this seems to offer the best of both worlds - improved matching between the wire and the coax, but no retuning necessary. It's rather expensive, though, and it may be that I'd have been just as well off with a home brew transformer on a ferrite ring...

The other potential advantage of an ATU, filtering out of strong signals well away from where you're listening, seems to be completely irrelevant on the HF-225. I've never yet found a case where switching in the attenuator did anything beneficial. The receiver's front end seems to be excellent in this respect.

I've got the sychronous detector option, and I wouldn't be without it. It quite often makes a heavily fading signal quite pleasant to listen to. Pity it doesn't have a selectable sideband option, though - I quite often find myself tuning an AM signal in the LSB or USB modes to try to get rid of an adjacent interfering signal.

Would I buy it again? Yes, unless I decided that I really wanted a receiver which offered a computer interface.

****
Sony SW-1 - 2

I bought an SW1E over a year ago, for listening to broadcast SW and FM at home and while travelling. I like this very small radio a lot. It is maybe expensive for a portable, but the build quality is very good, - everything looks and feels right.
Battery life is good, and the set DOES work with NiCads (2*AA) contrary to the instructions. Reception of broadcast SW is good, either with the whip or clothes-line antenna. I've never noticed any big problems from adjacent channels either. As a bonus, FM stereo reception is good through headphones. Audio quality from the in-built speaker is fair, but you'll want to use phones for noisy environments. The only bug with this radio is the memory capacity - only 10 mems is really not enough to cover ALL of AM and FM.
Summary - if you want a very small portable, and appreciate high quality (and can afford it), I would recommend the SW1E. Note the E, which denotes the SW1 kit without the active antenna and brief case - these add a lot to the price, and I don't rate the antenna too highly either.

****
Sony SW-15 - 1

I bought one of these puppies on impulse the other day (at my age you should give in to the occasional impulse, just so they keep coming). Cost $85; you could probably do better by shopping the discounters.

Specs:

Dual Conversion Receiver, 6 1/2 x 4 x 1 1/2 inches, 3 AA or 4.5v DC.

Nine Bands:

FM: 76-108 Mhz, 10.7 Mhz IF.

SW: 5.775 -6.425; 6.875-7.525; 9.375-10.025; 11.6.5-12.265; 15.00-15.65 17.50-18.15; 21.325-21.975. 1st IF 10.7 Mhz; 2nd IF 455 Khz.

MW: 530 - 1710 Khz; 455 Khz IF.

Analog Tuning dial, volume control, music/news tone switch, 7 position SW band selector. FM/MW/SW select buttons double as "on" switches. "Off" button. "Hold" button to disable "on" (prevents accidental turnons) Slide rule, multicolumn frequency display. Hand strap, foldout stand to hold at angle on table, soft carrying case. Basic shortwave guide. Telescoping antenna. FM/MW/SW "on" and tuning LEDs. Mono earphone jack.

Subjective Review:

I'm pretty impressed. Sensitivity is up there with the Pomtrex [:-)] without the "splatter" of strong stations. Analog tuning dial requires a delicate touch but for me that's part of the fun. Drift seems nonexistent; you get a station and it keeps it without a lot of vernier twiddling. MW performance was surprisingly good, as was FM. I'd recommend it as a starter radio.

****
Sony ICF-5100 - 1

I bought this radio in Kuala Lumpur in 1988, and I'm not sure if it goes by the same model number in other parts of the world. It is a shirt pocket analog tuned radio with coverage from 6MZ to about 21MZ in seven bands. The radio is very rugged and has served me well despite of the physical abuse it has gone through. Because of its small size the speaker is only small and the sound from it it a little tinny, but I used it mainly to receive news in countries without English language news services and in remote areas while camping etc. I recommend this radio to anyone, who considers size the most important factor. Cost was about US$70.

****
Sony ICF-7601 - 2

In some respects this is my favorite radio. No bells no whistles no FM stereo -- just a good solid (feels like a small brick)

analogue unit. It covers AM, FM and has 10 SW bands that cover most of the "out of band" frequencies. Band switching on SW is done by a slide on the front of the radio while buttons are used to switch from AM to FM to SW. The dial is accurate to 5 kHz so is very easy to locate a station. I believe that it was simply the best low cost analogue rig out there. It's still around and can be had for well under $100.00. Grab it!!

I have a 7601 also. Most of its weight is from the batteries and the speaker, giving it better tone and volume than smaller, lighter sets.

As with other cheap analog sets, it wasn't very hot out of the box.

If you "super tweek" the 7601, it's pretty good on AM, but no match for a 2010 or Superradio III. Most of the shortwave bands peaked up well, but I never could get 19 meters working right. As with most analog portables, the whip is part of the RF tuned circuit, so one must be careful to duplicate the exact listening conditions when tweeking the radio. Even the presence of headphones will shift the antenna tuning.

Unfortunately the 7601 picks up FM stations at various places on the shortwave bands. If you're far enough away from FM and TV stations you might have room for an R-390.

When going on trips I usually take my SW-1 because of the convenience of the presets and the reception flexibility provided by the active antenna that comes with it.

****
Sony ICF-SW33 - 1

I've owned this radio (SW33) for about 9 months and use it as my "carrying around the house rig." It was purchased to replace a Sony 7601 that now resides on my desk at college (things electronic can grow legs on a college campus). By far the best features of this unit are its convenient size and excellent performance on all bands, AM, SW and FM stereo. Don't get me wrong -- this is not a DX machine on SW but for listening to the major broadcasters, it's excellent.

The single filter selection seems just about right and tuning on SW is in 1 kHz intervals. This at least gives you a "fighting chance" to move away from interference. That's a major improvement over the 5 kHz that many radios in this price range allow. In addition, the dual conversion design on SW keeps image interference at bay - a major plus for a small portable.

The radio does not have a keypad so entering frequencies is a bit clumsy. However, by entering the middle frequency of each of the major SW bands in the 7 memories (5 memories plus 2 timer

memories) and slewing up or down from those positions you can get around reasonability fast. The SW bands are changed by a combination of 2 keystrokes.

The sleep control (shuts the radio off after 1 hour) can let you be lulled to sleep and the timer alarm can make sure that you get to work on time (radio shuts down after 2 hours if it is turned on by the timer). Setting the radio alarm is very easy - once you have set the clock, but that frankly, is a pain. The clock function, which works very well (combination world/home time), takes at least 7 distinct steps to set it. Fortunately the clock is fairly accurate (looses about 0.2 sec/day) so you don't have to reset it very often. The lighted dial (stays on for 20 sec at the touch of a button) is a nice touch.

Battery life is excellent contrary to the 1994 Passport to World Band Radio (see below). The radio has a battery "gauge" that is activated at the touch of a button radio and shows in the display as a battery icon with 3, 2, 1 or 0 dots inside of the battery outline. It disappears after about 5 seconds. As soon as the number of dots reaches 0, the radio shuts off immediately. I ran a a series of tests with Radio Shacks Super Alkaline batteries and got the following results: 3 dots showed for 37 hours, then 2 dots showed for an additional 11 hours, and finally 1 dot showed for 3.0 hours for a total of 51 hours. (Radio ran 1.5 to 2.5 hours/day with the volume control set at 1/2 volume most of the time). At $2.89 (plus 5% for tax) for a package of four AA batteries (the radio takes 3), that figures out to 4.5 cents/hour which is excellent. This figure differs greatly from that given in the 1994 Passport (25-30 cents/hour). I have no explaination for the difference but I stand by my test values.

Would I recommend this radio to anyone? If you do a lot of band-scanning, forget it; it will drive you crazy. But at about $140.00 plus shipping (NYC mail-order) it's an excellent "second" radio to carry around for listening to the major broadcasters. I like it!

****
Realistic DX-440 - 2

I have a DX-440 and I think it is a good 'dabble' radio but if I ever get serious I will look for a > $500 table model.

I love this radio! It's my main radio and I use it exclusively at home, moving it from room to room. It really is too large for travel

I've found the sensitivity to be tremendous on SW, MW and FM! Very rarely do I need to attach a clothsline antenna! It has continuous SW coverage, a great sounding speaker, BASS and Treble controls, two bandwidths, great sensitivity, good spurious signal rejection...It has all the features I wanted in a starter radio! I bought it about three years ago on sale for $150.00! I still

don't know why Radio Shack discontinued it. If you're looking for a good starter shortwave radio and can still find one laying about at a Radio Shack store priced to move, GRAB IT!

****
DAK DMR-3000 - 1

I bought this radio since they have a 30-day money back guarantee and I did not know if I would like the hobby or the radio. Good points: direct-entry tuning, 36 station memories, fairly small so it is easy to travel with, speaker sound was good, reception was okay, but improved dramatically with the addition of the Radio Shack 23' rollup longwire ($8.95). Bad points: only 5kHz tuning steps, only major broadcast bands tunable (large gaps between bands), selectivity not so good, no fine tuning, no BFO, no SSB or CW, poor FM reception. All in all, not a bad radio of $69.90, however, it left me wanting for more, so I got rid of it.

I have seen a couple of posts asking for a low cost SW receivers. I have recently bought a DAK Model DMR-3000, for just $69.90+$6.00 shipping from DAK - a mail order company.
The receiver has a direct access, so you can type in the desired frequency, and a manual / automatic scanning system. It also has a dual time clock with alarm and 'sleep' timer. Unfortunately you can tune only to the commercial frequencies on SW, AM and FM bands. I have to say though that cheapness comes at a price. The first receiver I got was defective so I had to ship it back and ask for a replacement. Now, I received a new one which works very well.

Compared to my Sony ICF-7601 the DAK unit is an insensitive brick. The fancy clock and timer features aren't really worth it. About the only thing nice is the FM Stereo support if you plug in headphones but the FM sensitivity leaves much to be desired as well.
Something else to watch for.... That pretty lettering on the buttons will wear off REAL fast. If you haven't used it much yet you won't see a wear off REAL fast. If you haven't used it much yet you won't see a problem. After you've done some tuning you'll see the pretty arrows disappear from the buttons.

****
Sangean ATS-803A - 1

Since I was now turned on by SWL'ing, I moved up to what most people agree is the best all-around radio for this price. Good points: excellent frequency band coverage (150kHz to 30mHz), fine tuning, good selectivity, BFO for SSB and CW, many scanning options, lots of accessories included, good AM and FM reception. Bad points: way too big to travel with, high battery consumption, synthesizer noise in background all the time, scanning frequently

skipped lots of "listenable" stations that I was able to get by manual tuning (what's the use in scanning, then?). I found that adding a longwire antenna only increased interference and noise while not improving the set's scanning sensitivity. Overall, a fairly good radio for the price...

I have a Sangean ATS803A which I love. Comments to quote me on would be that it's an excellent beginner's radio for the price. Although I've heard that the 818 is the "latest and greatest" in this price/performance category. I especially love the full coverage 150kc-30mhz and the (albeit lo tech bfo) SSB capability.

****
Sony ICF-SW20 - 1

I was in dispair when I could not find a decent travel portable for under $200. However, I accidentally crossed paths with a Sony ICF-SW20 on sale (normally $99, on sale for $49.99) at a local store and had to check it out. It is an analogue set, but since I got a 30-day return policy on it, what the heck? Good points: analogue tuning so no problem with confining 5kHz tuning steps, INCREDIBLE SENSITIVITY - this radio blew the DAK and Sangean away with the number of stations I picked up, good selectivity (no fine tuning knob - all you need to do is turn the tuning knob slowly), tiny size (4"w x 3"t x 1"d), small whip antenna (only 18"), addition of Radio Shack rollup longwire increased sensitivity even more, great low price (if I lose it or its gets destroyed, no problem replacing it), tuning bands are wider than the major broadcast bands, so you do get some utilitiy reception as well as WWV, AM and FM are really sensitive while FM goes from 76mHz to 108mHz so I can pick up some TV as well. Bad points: frequencies cover only seven broadcast bands (I can live with that, though), only monaural earphone included (however, you can get a $1.39 mono to stereo headphone plug), no BFO for SSB or CW, no station memories. All in all, this radio gave me the best price/features/size ratio of the ones I checked out first-hand. It's a keeper for me!

****
Magnavox 3625 - 1

Finally received my Magnavox 3625! Well, I'm certainly happy I purchased this little radio. Sure, it's not top shelf, but it's suitable for travel purposes and gives adequate SW coverage.

Has these features:
Travel Lock
Alarm (beeps, does not turn on radio)
Sleep Timer
9/10 KHz switch - for world travel
12 hour clock (however, when unit is swith to 9 KHz steps 24 hour

clock kicks in)
20 presets - 5 for each band FM, AM, SW1, SW2
Dual time
Auto store - this feature allows the radio to automatically find
the five strongest stations in an area and program
them into the memory of the FM & AM band.
Back stand
Antenna swivels and rotates
Runs on four AA batteries.

Well, the sensitivity is quite good. Steps in 1 KHz increments.
No tuning knob but the slew tuning buttons work just fine. It's
about the size of a paperback book and can be taken anywhere
reasonably well. No carrying strap,
though. The SW coverage is limited but it grabs the major
broadcasters exceptionally well. Example: the 41 meter band is
covered from 7100 to 7300. So if you want to listen to the BBC
on 7325, you're oput of luck.

However, I like to listen to the BBC on 12095 or 15070 European
signals during the day that I cangrab when I attach a long wire.
The 3625 can't tune these freqs. but it can grab 15400 (from
africa) WITHOUT a long wire antenna! I'm pretty impressed.

Bottom line....A GREAT little travel radio for $70.00! Call a
Magnavox outlet if you are interested.

****
Magnavox AE-3805 - 2

Great little digital portable. Good sensitivity, average
selectivity. Covers MW (in 10 kHz steps only), FM (no stereo),
and SW in two "bands": 3200-7300 kHz and 9500-21750 kHz. Built-
in timer/clock (12 hour format only), 5 programmable memory
locations per band. Great for travel use.

Purchased from Damark for $49 in May, 1993.

$50 from Damark closeout -- cheapie category

****
Emerson PSW-4010 - 1

Great analog portable. Good sensitivity and selectivity. Covers
MW, FM (stereo through headphones), and SW in 8 bands (roughly
split out as 13m, 16m, 19m, 25m, 31m, 41m, 49m, and
60/75/90/120m). An excellent travel portable.
This is the same radio as the Sangean SG-789.

Purchased from DAK for $49 in June, 1988.

****
Sony ICF-5900W - 1

Sony ICF-5900W was a good radio in its day, but isn't worth
listing now.

****
Icom IC-R70 - 1

I purchased my R70 in early 1983. It came with a scratched plastic
window for the digital display, which the factory replaced. It is
an extremely sensitive receiver. I installed the FM detector board
option, which is highly useful for Sub-Carrier detection from FM
broadcast receivers in conjuction with the R70's ability to tune
below 100khz without a frequency convertor. The so-called PassBand
Tuning (PBT), in actuality an asymmetrical bandwidth narrowing
control, is very mediocre with the factory 455khz filters. Replacing
the 455Khz ceramic SSB filter with a Fox-Tango FT-44 2.4khz 8-pole
crystal filter (equivolent to the ICOM FL-44) makes the passband
filter work as one would want. The AM 455Khz ceramic filter is junk,
and was replaced with a higher quality "4Khz" ceramic filter from
the long-defunct Radio Plus firm. The actual specs for the 4Khz filter
indicate that it is a slightly asymmetrical filter of 5.6Khz bandwidth,
causing a slight degredation of the "highs" (The original spec is
for a 6Khz bandwidth; the 9Mhz AM filter is a 6-pole device). Inclusion
of both replacement 455Khz filters results in a combined shape factor
of much better than 2:1 on AM or SSB. In addition, the RF amplifier
was enabled for AM broadcast band use, and an MOV was placed across
the AC input for protection against voltage transients. [Actually,
a Transorb would be far better in defending against narrow transients.]
For awhile, I replaced the diode AM detector with a Shottkey diode,
but my ears could detect no difference in distortion, and so the
original AM diode was returned to the circuitry. It's been serviced
once by ICOM for an intermittant problem ($150 ouch). There exists
several modifications to enable selection of the 455Khz SSB filter
whilst in AM mode for additional selectivity.

Drake R8 - 1

****
Drake SPR-4 - 1

****
Icom R-71A - 2

Eskab & Edvis of Sweden used to offer a Phase-Locked AM (PLAM) detector for
the R-70 and later R-71; they also offer a version for the NRD525. I have
the R71 version. It is a synchronous detector which allows selection of USB
or LSB via the IF filter/BFO offset. The PLAM board phase-locks one of the
R71 local oscillators (I forget which one, probably the BFO) to the AM
carrier. It contains its own product detector. The lock range is not very
large, perhaps +/- 20 Hz. The detector seems to have lower distortion than

the ICOM AM detector.

Compared to ECSSB, aside from the advantages of phase-locking the product detector BFO, the PLAM unit also lowers the corner-frequency of ICOM's low-pass audio filter, giving better bass response than normal SSB mode on the R71. I find that this improves the intelligibility of the signal.

The PLAM board piggybacks in the mounting area for the ICOM FM option board; both can coexist. Installation is somewhat difficult, as it involves connecting over a dozen wires to various boards in the R71.

Eskab & Edvis also offered a 4 KHz 2nd IF crystal filter for the R71. This installs fairly easily in place of the narrow CW filter. It is very much better than the stock ICOM 6 kHz bandwidth, which is wide-open until it hits at cheap ceramic filter in the 3rd (455 kHz) IF.

I don't know if Eskab & Edvis still offer the R-71 PLAM and 4 kHz filter. They used to advertise in the WRTH.

Regarding other options: I believe Sherwood Engineering offers an outboard synchronous detector for the R71 as well as other receivers. The Kiwa MAP unit should also be adaptable to the R71.

Also, Dom Moman of Shortwave Horizons publishes a modification manual, which details mods like enabling the preamp on MW, true pass-band tuning, sub-10 Hz RIT, etc.

****
Kenwood R-2000 - 1

****
Kenwood R-5000 - 1

****
Kenwood TS-450-1

I know it's not a reciever, but since it has general coverage,I decided to put it in here.The TS-450S is an amateur transciever that costs little more than a R-5000,and if you have your ham ticket or are thinking about getting it,may be worth checking out if you are in the market for a new toy.I'd be willing to bet the replacement for the 5000 will look just like the 450,just like the 5000 looks like the 450's predacessor,the TS440S.First thing it is EXACTLY the same size as the 5000/440.Unlike the 5000/440,it has an LCD display that is unlike any other I've ever seen.It is almost too bright!The brightness cannot be adjusted,unfortunatly.The 450 recieves in all the standard modes except for fax.It has a"normal"keypad unlike the 5000 and the aggravating CW that is produce when a major button is pressed can be silenced by y -a simple menuss,you dont have to cut a wire like the 5000he S-Meter is a bar-graph type that I like but some people dont.It also has an Audio meter function that kin baffles me.I still dont know what use it is,but it looks nice!Probably the most notable thing you will observe when using the 450 is the QUIET!It is so quiet,it seems strange the first couple of times you use it.The AGC is non-defeatable and has a fast/slow toggle.It is the strangest

and slowest AGC I've ever seen,on slow the S-Meter just sits there and then SLOWLY goes down.On fast,it just isn't quite so slow.It seems to work ok,but is really odd.The stock filter for AM is a mile wide but you can add the YK88 AM filter but you wll lose the open slot for the 8.83 ssb filter.I'm not sure,but the 450 seems to have the same stock am filter the 5000 has.On SSB,it uses one of the better Murata ceramic filters and is ok but the optional SSB filters are highly recommended.The audio is FANTASTIC on all modes and if you put one of the minimus speakers from Radio Shack on it,you will like it a lot.Dont bother with the Kenwood speakers,the one that goes with the 450 is not too good and is expensive too!The ergonomics are pretty good,except for the tuning knob,yes like all the recent vintage Kenwood rigs,IT DOESN'T HAVE A FINGER HOLE!!Why does Kenwood insist on putting these awful knobs on all the rigs they have made lately!All in all,it is a very good riever in almost all respects,and since t it only costs about $100 more than a 5000,it is worth a lookND as a bonus, the recieve coverage goes up to 40 mhz!If you are into low band scanning,you will hear things on the 450 you never knew existed on your scanner.If you can swing the 450's sister model the TS690,you can recieve all the way to 60 mhz. When the 5000 is put out to pasture,if it's replacement is the 450 without the transmitter,it will be very tough competition for the other makes.All it needs is Sync.detection and you really couldn't ask for much more.

****
Japan Radio Company NRD-515

THE all time most user-friendly recieveof recent vintagHas PBT,analog fine tune,four I.F.bandwiths,AM,LSB,USB,and RTTY modes.There is no squelch but it really doesnt matter much.Of all the recievers I have owned,or ad over here to play with,it is the most sensitive in the SSB modeI have the standard 6 and 2.4 khz filters,and th600 and 300 hz filters whitch are great for RTTY or CW(if you are truly desparate!)The "protection"diodes have been removed due to intermod from a local AM station.The reciever's case,front and back panels are made of Aluminum,no plastic to crack on the 515!The audio in AM is very bad,almost as bad as the Icom R-71a,but in a different way.The audio is "fuzzy"out of the speaker jack,but not too bad out of the record jack but still a little "fuzzy".In the SSB modes,the audio is pretty clear and doesn't fatigue me like the Icom dos far as thergonomics goes,it's almost prefect!All the knobs are the right size,the tuning knob is large and has a nice deep finger hole(Kenwood,are you listening???).The S-meter is big and easily seen across the room.Dynamic range is very good after the diodes have been clipped(a one minute operation).The filters all are good quality and have good shape factors.This was the first "affordable"rig that had a memory option that was worth something with 24 or 96 channels available. The NDH-518 I have(96 ch.)is also made totally out of cast and sheet aluminum and matches the 515's styling.It stores frequency only,unfortunatly, due to the year it was designeIm guessing.There are lots of these recievers floating around on the used market for about $600 or so.Universal seems to have a lot of them passing thrgh the store.

****
Japan Radio Company NRD-525 - 1

This is a great reciever,marred only by bad audio and a hiss that will drive
you bonkers if you have good hearing and a speaker that can put out the highs.
I have had two of these,the first I traded for a sateite setup,and the one I
have now.The newer reciever has mucbetter audio then the first one and lesess
hiss too.Ergonomics are very good MUCH,MUCH better than the Drake
R-8.(IMHO,the Drake is seriously overrated and all the stuff about made in the
U.S.A.is kind of funny cause a LOT of the innards are MADE IN JAPAN!!!)Oh
well,back to the 525,if you are into AM,it's probably not the reciever for you,
but in allthe other modes,it is one of the best consumer grade recievers ever
made.Performance in all modes is basically excellent except fothe audio pr
problem,and stability is rock solid.JRC has only cut a few corners compared
to the 515,probably the ultimate in construction for consumer recievers.
The case is made of very thin sheet metal and the front panel is plastic.The
keys fit loose in the keypad but work ok.The display has four brightness
levels and is very easily read from across the room.The S-Meter is "digital"
and is a floating vertical bar segment that seems to be yellow on some samples,
and green on some others.It is sort of "spastic"and twitched a lot on the
first one I had,but not as much on the seconone.The first 525 I had would
"click" on strong AM signals,but the new one doesn't.The main tuning knob
spins very smoothly and has a nice finger hole.(KENWOOD,WHY DONT YOU LISTEN!!)
All in all, a great reciever.

****
Japan Radio Company NRD-535D - 2

I have been using a NRD-535 for two years and i am very pleased
with it. Although the relative high price makes this a radio
for the serious DXer and maybe not the average Shortwave listener.

The NRD-535 has very good ergonomics. It is very easy to operate
during long listening passes. It has 200 memory channels which comes
in handy for storing interesting frequencies that you want to
check later, or stations that you want to check regulary.

+ side:
On the plus side there is the BWC and the very good sensitivity.
The BWC combined with the PBT makes it possible to make
a station readable that is very close to another station, or
a interfering RTTY transmitter. I find that i mostly uses
the SSB mode and zero tunes the station, and then uses the
BWC and PBT to get the most readable signal. The BWC and
PBT has saved a lot of reports for me. The sensitivity
is excelent. It is among the best in this price class.

- side:
The audio in the built in speaker is mediocre to put it mildly.
A station that you read loud and clear in the earphones can be
inaudible in the built in speaker. The selectivity is not as
good as it could be. The NRD is very sensitive for splatter from
nearby stations, and this can totally drown the station that you
want to listen to. The ECSS option that you can equip your NRD with
is a joke. I have it installed but i NEVER uses it. The only time
you can use the ECSS with any improvement of the signal, is if the

received signal is strong to begin with. Don't waste your money on the ECSS.

The conclusion is that the NRD-535 is a very good receiver for the serious DXer but it has some shortcomings. The 535 is much better than the Icom R-70 that i had before, and i would recommend it to anyone that asked me. What you might want to do is change the filters to somewhat sharper filters. That goes for both the 9 MHz and the 455 kHz filters.

****
Yaesu FRG-100 - 1

****
Panasonic RFB-65L - 2

$220 from Universal, EEB, etc. -- my main set, an excellent portable, many features, nice construction and details.

****
Sony SW-55 - 2

This is my principal radio at the present time (I also have the Sony ICF-SW33 and the Sony 7601). This rig is an extremely sophisticated piece of equipment. I especially like the fact that you can store up to 125 frequencies on 25 electronic pages that can be named as you wish (by country). Once programed this is very convenient. The two filter selections are well chosen (much better than the stock Sony 2010 filters). My use the radio to copy WEFAX with excellent results attests to its stability (and that it receives USB and LSB).

The versatile timer/alarm and tape remote feature allow automatic recording with certain tape recorders (Sony and others) of up to five times and frequencies in a 24 hour period. I use this feature all of the time. Audio (stereo on FM) qualitity for a portable is very good; better I believe than the stock 2010 although as with the 2010, it is improved with a set of external speakers.

Unlike the 2010, the SW55 does not have synchronous detection. That's too bad because I believe that if it had this feature it would blow away
tition. As it stands it is an excellent radio. Most interference can be eliminated with the narrow filter or moving away from the interference a bit (the radio is tunable in steps of 0.1 kHz) so the lack of sd is not critical. I really believe that Sony did not include it because it would have then had a very negative impact on sales of the SW77.

Would I buy this radio again. You bet! The only problem I've had in the year an
owned it is that the lettering has worn off the 1, 5, 0 and EXE

keys on the keypad. That should not happen on a $300.00 radio!

I just got a SW-55 for Christmas and find it to be an outstanding radio. Now that I've said that, you should know that I am new to all of this "DX-ing" (is that how you say it?). However, I can tell you that it's reception with the built-in antenna and with the included auxiliary antenna is very good. I found that the radio comes pre-programmed with a number of stations (BBC, Radio Moscow, etc.) and they come in great.

As for your questions, I've found the speaker in the SW-55 to be very high quality, delivering plenty of volume and good sound. There are several "tone" switches (news vs. music setting, etc.) that enhance the reception and its sound. And, the unit is packaged well for travel.

The radio itself has several nice features (I don't know how they compare to other radios since I didn't comparison shop). There are several output jacks that make it easy to connect to external speakers, tape recorders, headphones, etc. There are local/long distance antenna settings. There are lots of ways to set and look at the time (local, UTC, Daylight savings, etc.) There are alarms and sleep settings (for on the road).

The tuning portion is quite nice. The radio of course offers digital tuning (punching numbers in to get to a freq.). But I find that I often use the "analog" tuning dial as well to either fine tune a station or to see what else is out there.

Best of all, the unit is packaged well. As a new user, I have enjoyed the little things Sony has done to make this experience a good one for the new user. Everything from the documentation to the carrying case has made it quick and easy for me to start listening to short wave. Included is a book that is a publishing of all the various countries broadcasting, with their freqs and times. (I gather that these things change quite a bit, but I presume that Sony updates it often)

****
Philips AE3905 - 1

In short, in my experience, the AE3905 is no real great shakes. It looks neat as hell, and marks its owner as a man of taste and distinction with more money than brains (like I said, *I* have one). Its shortwave performance is mediocre. Using this in a hotel last February, I found that attaching the included reel antenna caused the radio to overload fairly badly. The batteries don't last very long. The filters included are fair, but you still get a fair amount of interference from adjacent stations (not as bad as some small portables, but not good). I certainly wouldn't want to use this as my primary radio. For portability, it's fantastic. I can listen to the BBC or VoA anywhere. The radio fits in my shirt pocket, although reception in my pocket isn't all that good. In short, the radio isn't worth what Philips charges for it, but if you've got more money than you know what to do with and a desire to have a flashy looking toy, it'll do.

The radio has only recently been available in small quantities in the U.S., and appears to have been discontinued in Europe. I got a reconditioned copy for $179 from the Magnavox factory outlet in Kentucky. Universal lists the radio in their catalog for something like $250 new if I recall correctly. You're not likely to find it anywhere else.

****
WATKINS-JOHNSON HF-1000 HF RECEIVER

I will be doing a lot of comparisons to my other receiver, an NRD-525. To give a basis for comparison, the NRD-525 has been upgraded by the following modifications:

ESKA PLAM board with four added filters following the IF strip
Installation of ESKA Aux filter in the NRD Aux position
Installation of the JRC 1.8 KHz filter in the Narrow position
Replacement of RF chokes on the filter board with shielded units
ESKA agc modification

These modifications have improved the shape factor on the NRD's filters from an average of 2.0:1 to 1.7:1 (60:6 dB). The ultimate rejection has improved from about -60 dB to -75 dB. These modifications are noticeable in on the air listening tests. The NRD hiss has been removed.

About two months ago, I bought another receiver, a Watkins-Johnson HF-1000. I didn't really think this receiver would be much better than the NRD, and I intended to return it if this was the case. I was wrong. The Watkins-Johnson receiver is clearly superior to the NRD in on the air listening tests, almost in every case. In rare cases it is a tie. The comparisons are done using an A/B switch that switches both the RF and audio lines so that comparisons can be made quickly on the same signal. Comparisons were all done in ECSS mode with the receiver settings made as close as possible to each other.

I also did some bench testing of both receivers, and the numbers that the tests give are not all that much different for both receivers, with the exception of filter shape factor. The HF-1000 shape factors run about 1.1:1 (60:6 dB). This does not explain the main difference between the comparisons, however. The HF-1000 seems to be superior in pulling out weak signals. I have heard many signals that are muddled and hard to understand on the NRD-525 sound sharp and clear on the HF-1000. Several other points:

AGC: The digitally processed AGC on the HF-1000 is far superior to the analog AGC on the NRD, even with the ESKA kit installed.
Notch filter: Again, the digital IF notch filter is superior.
Audio: The NRD audio has always sounded low frequency and mushy; audio on the HF-1000 is crisp and clear. This is an important item.
Operating: I like the controls on the HF-1000. They are flexible, yet easy to use. The set is a pleasure to operate.
Synthesizer spikes: The NRD has a synthesizer spike every 100 KHz. While these are not all that strong, some of them fall on inconvenient

frequencies, like the propagation beacons on 14100 KHz. There are
a few spikes on the HF-1000 at even 2 MHz points.

The only shortcomings in the HF-1000 I've noticed are the lack of synchronous
detection (this is supposed to be sent out as an upgrade chip later), and
IF passband tuning would be useful in the SSB modes. It is present in CW.

As you have probably guessed, I'm real happy with this receiver. I think
it will be the last one I will have to buy for quite a while.

Watkins-Johnson HF-1000 Review Part 2

Watkins-Johnson SAM option for HF-1000

Recently I received the firmware for installing Synchronous AM
(SAM) detection in my HF-1000 receiver. I was able to install it in
about 1/2 hour and it worked great. In testing it I compared it to the
ESKA phase lock AM board installed in my NRD-525. Here are the results
for strong and weak signals:

Parameter	ESKA+NRD	HF-1000+SAM
Weak signal lock range	+- 20 Hz	+-250 Hz
Strong sig lock range	+- 40 Hz	+-900 Hz

As an on-the-air test I tried to lock onto Radio Pyongyang, 13760 KHz at
1300 UTC. The signal was weak and fading rapidly at 1300 UTC and was being
broadcast on 13760.1 KHz. The HF-1000 was able to lock it immediately even
when set to 13760.000. NRD was not able to lock it at all, even when set to
13760.1. Impressive!

Another modification in the new firmware is a change in the AGC function.
It is now possible to set three decay rates from the front panel for each
AGC setting, Fast, Medium and Slow. In addition it is possible to allow
the manual gain setting to control the AGC threshold while in AGC mode.
This is a great help for the AGC control. I spent many hours trying to
get the AGC decay rates correct on my NRD receiver, and was never happy
with that AGC. This required pulling out the IF board, replacing some of
the SMDs, putting it all back together, and then trying it. Digital AGC
processing on the HF-1000 makes this a snap, taking only a few seconds.

After several months of using this new mode of reception, it is the one
I nearly always use for SWLing and DXing. For weak AM signals it is hard
to beat. If the signal is readable at all, it will be able to lock on it.
By using both sidebands, you end up with a better signal to noise ratio
than with only one sideband. The HF-1000 is even more impressive now
with this addition. The only times that I have had to resort to ECSS on
AM signals is when there is interference on one sideband. Watkins-Johnson
reports that they will have single sideband SAM in the future which will
get around this. There are several other options that they are working on,
one of which is a plug in board for PC processing. I assume this will have
real time spectrum analysis and memory functions built in.

****
AR3000 - 1

My general impression, is that this is anyhow a very good apparate. It offers continuous coverage 0.1 : 2036 Mhz, all mode, RS232 interfacing, quite good operating commands, triple conversion, 400 memories; it is very compact (small tabletop, 1.2 Kg.), semi-portable; its 13 auto-selected front-end band filters reduce to some extent unavoidable intermodulation. In general, this set offers a self contained and very well balanced compromise of a lot of different demanding features, but will show its best when fully interfaced.

Its price, here in Italy, has been varying greatly during the years. Therefore I cannot say how it really competes with the choice of HF receiver + scanner setup. It is still unclear to me how far is the AR3000 from dedicated traffic receivers.

I'm finding a number of defects and "whish it was" that I'm going to list (I would like to hear comments about), but perhaps I'm just pretending too much from a receiver in which something had to be traded off between versatility and performance. Please note that I have a 4 years old AR3000; some defects could have been amelio-rated in the 3000A, or may eventually be specific of my unit.

Hardware limits:

-AM selectivity is mediocre (approx 10 khz bandwidth). I feel the lack of a variable Am bandwidth. SWL in crowded bands is too often spoiled by the 5Khz whistle. Thinking it was a problem of i.f. detuning, I once sent it to the service to have it retuned, but with no perceivable gain.

-In AM I do experience blocking. A strong transmitter mutes any weaker adjacent signal lying some -+30 khz apart. I suspect this may be rather a problem of AGC voltage (see below on squelch), because the feedback signal is obtained from the previous to the last i.f. stage, which may have a larger than necessary (for AM) bandwidth.

-The squelch control (essential in search mode) is not very functional. On my set almost everything passes for knob positions below .3 and only >S6 passes when I increase to .5. It may be a problem of adjustment, but also reflect the inaccurate behaviour of the S-meter, which (I have no measurements to support) seems not properly logarithmic. I have the impression that weak signals give a high S readout when close to stronger ones, because the S-meter averages on a larger bandwidth than the demodulator.
Also, the squelch just mutes the a.f. output, but not the line out signal.

-The internal speaker fidelity is scarce. No tone controls exist. Clarity improves a lot when connected to an external speaker or lineout. No noise reduction circuitry is present. External audio equalization does a lot, but of course is not the cure for low selectivity.

-There is no i.f. direct output for say a spectrum analyzer or a different demodulator (say wide band AM for satellite or TV, stereo FM decoder, sinchro SB AM decoder). A modify could be to buffer it to a backpanel jack.

-Intermodulation IS present. I live very close to power MW transmitter, and in the times they're on the whole band .5 : 2.5 Mhz is unusable, with crosstalk on every possible combination of transmitter frequencies. At evening I sometimes hear sw bc stations crosstalks on 20 : 30 Mhz, even with a short random wire antenna. However, I don't hear crosstalk due to FM transmitters, which are also close to my place. The 13 front end filters seem to do their job, since strong signals don't cause crosstalk out of their respective preselector bands.

-I'm not very satisfied with the small and clicking rotary tuning control. In the AR3000a it has been replaced with a (I guess optically encoded) smooth one. I would rather appreciate a jog-shuttle like the one on VCRs, and the mod itself seems quite easy too.
The tuning is however digital, and stepping frequency causes clicks, which eventually trigger the squelch threshold during search. The final a.f. is briefly muted while stepping, but I prefer the line-out signal which is unaffected and thus has a faster response.

-There is a single antenna input for the entire range. I think this however is correct, because whichever choice on different antennas is entirely dependent on the user setup, and should be rather left to an externally programmed antenna switch.

-Some digital RFI is generated, expecially in the high HF and low VHF. A real antenna connected with a shielded cable and a good earth however wash it out.

-Some small change in sensivity and background noise can be perceived when passing across one of the 13 band boundaries (by the way, they are 0.1-0.5, 0.5-2.5, 2.5-10, 10-30, 30-50, 50-108, 108-136, 136-174, 174-224, 224-335, 335-500, 500-940, 940-2036 Mhz), but this is unavoidable, and also due to the change of the superetherodyne scheme.

Software limitations:

-Scanning is already very versatile for such a small machine. However, auto memory storage of catched frequencies was forgotten. Also, the oddities in the S-metering (see above) impose manual choice when scanning non regularly channellized bands.

-There is a priority channel lookup feature, but the attention threshold has to be the current squelch position. Apparently (see
//ftp.funet.fi/pub/dx/receivers/mods/aor300.mod) in
the 3000a a programmable lookup time was implemented, but it is not present on the 3000.

-The mode and the tuning step change are set with several keystrokes. I feel it quite tricky, expecially considering that I generally have to switch quickly between 50 Hz/SSB, 500Hz/Am, 1.25 Khz/nfm, 50 Khz/WFM. The step x10 command is

very useful, but not enough.

Since the S-meter signal is output on the RS232, and the unit may be fully remotely commanded, all this limits can be cleverly threspassed by an external control software, thought.

I have experienced problems with the 232 interface. The cpu goes crazy very easily when the connector is plugged in/out, unless the "remote" switch on pin 7 is previously operated. This is (I understand) the reason why it was added on the 3000a. When the cpu goes on the moon, one generally has to open the set and to push the reset button (backside of the keyboard), losing all the memories .
Also, I cannot interface the scanner with an Atari St, either because the TTL level Txdata is to low for that serial port or because the continuous output of the S-meter simply is too fast for the Atari bios.
Passing by, note that the RS232 speed can be set to 9600 baud with a switch on the cpu board.

Hi, I just received a pro-2032 for xmas and was wondering if there are any modifications I can do to it. Is this a decent scanner? I know it is a discontinued model. I think my wife paid $189. Any comments you have would be appreciated. Thanks,
John Arvidson

Cross-posted to: rec.radio.scanner,alt.radio.scanner

Here is a question I received by email....

Hi. I was browsing your AR8000 homepage. I gather the AR8000's computer
interface is not compatible with the CI-V ports common on Icom, Kenwood,
and various other scanners? Do you know if this is correct?

If so, it's a shame. I just got the Optoelectronics Scout frequency
counter, and it directly controls CI-V radios like my R-7100. It would
be great to use the Scout together with the AR8000, but it sounds like
that won't work. Foo.

png
.....

Does anyone know the answer to this fellow's query?
I am not familar with exactly what the others have. I do know that
the commands on the res 232 bus of the ar8000 are more extensice
then the other radios. If the Scout is designed with specific
units in mind and formats commands in a different way naturally
it isn't going to work out of the box.It will have to be updated
to match the new generation of commands.

Software can pin point one of three vfo's, read and write to them as well as
the standard 1000 scan memories etc. What more does the scout do?

Post here and mailto:"Peter N. Glaskowsky" <png@woof.net>

Jim.... Thanks for the info on the MilSat antenna, much appreciated! The design looks like it should work, I'm gonna give it a try. A friend of mine uses a military discone with a $200 preamp, and I can't find one of those. He hears a lot of good voice stuff, just have to sort thru the "unreadable" transmissions. Thanks again!

RE the 1500 MHz preamp.... I have one on my INMARSAT antenna, works great. It was from Down East Microwave. Their TX was 207-948-3741 in Troy ME, but I read an ad a few weeks ago saying that they have moved to Lebanon ME at 207-658-7758. It was about $125, really makes the INMARSAT beam work!

I have kept the following text for some months now and have been meaning to have a go and built one;

"For those of you interested in listening to the 242 to 270Mhz Milsat band, here are some tips and
equipment ideas to get you on the air. With our current activities in the Gulf, there's plenty to
hear !

The antenna I'm using is a 12 turn axial mode helix...the preamp is a 20Db gasfet from
Advanced Receiver Research. They advertise in QST. They dont stock a model for the Milsat
band, but they'll gladly build you one for around $100. Mine has a centre freq. of 262Mhz.

The receiver is a Yaesu FRG-9600. It's continuous coverage from 60 to 905Mhz, all mode
receive. Great little radio.

The helix antenna is VERY easy to build. For a centre freq. of 262Mhz the following dimensions
will give you about 16Db gain over the entire 242 to 270Mhz Milsat band:

Diameter of the helix - 14.5 inches
Circumference of helix - 45.4 inches
Pitch or spacing of turns - 11.35 inches

The dimensions are not critical. If you're within 10% of these numbers it'll work fine. The helix
element can be constructed from refrigeration type copper tubing, 1/4 inch diameter. The
reflector can be anything from chicken wire to hardware cloth. If you make it square, it should be

.8 to 1.0 wavelengths on a side, so 45 inches will work well.

The polarisation is Right Hand Circular, in other words, if you're standing behind the antenna, at
the feed point end, the turns of the coil should spiral away from you in a clockwise direction. The
nominal impedance of the above antenna is around 140 ohms. To get a good match to 52 ohm
coax, try making the first quarter turn at the feed point end run parallel to the reflector at about
1/8 to 1/4 inch spacing from it. This will act as an impedance matching transformer and give you
a pretty good match. DO use good low-loss coax, Belden 9913 will give you the best results. This
antenna has a beam width of 30 degrees and is VERY broadbanded. Be sure to use a non-
conductive boom, hardwood works, Fiberglas works much better. PVC tubing has too much sag,
don't even bother !

What will you hear? ALL kinds of things !!! There are many different satellites and modes on this
band. To really grasp what's up there, Larry Van Horn's book "Communications Satellites" is
REQUIRED reading.(Grove Enterprises-Box 98-Brasstown,N.C.-28902) As an example, I've
heard everything from the Secretary of State, to McMurdo Station Antarctica, to Soviet
telephone intercepts to A-10 and F-16 drivers involved in the current conflict. And that's just the
stuff that is "in the clear"! The Tactical traffic from Iraq is in the clear in am mode, and really
shouldn't be there at all. Due to poor frequency management, the UHF comm. frequency they've
chosen falls within the uplink passband of one of the satellite transponders. So, they're getting
re-broadcast on the satellite just like your local 2 meter repeater ! (Very Weak, though copyable).
80% of the signals in this band ARE digitally encrypted, but the other 20% are some of the most
interesting I've ever monitored.

The strongest signals are from Fleetsatcom 1(Pacific relay) in orbit at 100 degrees West, and
Fleetsatcom 3 (Atlantic relay), at 23 degrees West. Try tuning 260 to 262.4 MHz. Some of the
signals are strong enough to copy with only a ground plane or discone antenna."

A lot of people have emailed me requesting info. on the AOR1000XLT computer interface mod that I alluded to in my posting seeking to sell my scanner (it's still for sale, BTW). The mod is detailed in Bill Cheek's World Scanner Report, volume 4, number 4. It's described in four pages, hence, I will not retype it to post here, nor will I photocopy it and mail it to anyone or do anything other than tell you how to go help yourselves. You buy my scanner and you get all of the details, naturally.

Contact WSR via their BBS, the Hertzian Intercept. 619-578-9247 to request a back issue. I believe they cost about $4-$5 each. You can also send email to Bill Cheek and ask him about getting a copy or subscribing to WSR. The BBS runs 24-hours on weekends and from 5:30PM to !:30PM PDT (note that is West Coast time)

Cheek did not do the mod himself. He printed the instructions conceived by a Tom Snyder. I don't know him; I don't know if the mod works; how well it works or anything else. I don't work for WSR, Snyder, etc. etc. etc. I'll tell you this much: It's a major modification and should be done only by someone who knows their way around a schematic. It is not for novices, rank amateurs or anyone suffering from the DTs.

Now we interrupt this bulletin with a commercial message:

I bought an AOR1000XLT scanner about six months ago and have seldom used it (I've got too much stuff already, I guess). I'd like to sell it. It's in mint condition (no scratches, nicks, nada). It comes with earphone, AC adapter, car lighter adapter, carrying case, rubber duck antenna and four AA NiCads. I'm also including an 82-page Guide to the AOR1000, written by Howard Bornstein (the AOR's six-page instruction booklet is really cheesy).

The AOR1000XLT's features are:
-- 1000 memory channels
-- 10 search banks and 10 scan banks
-- lockouts for channels and search/scan banks
-- 500 KHz to 1.3 GHz continuous coverage
-- 20 channel per second search and scan speeds
-- can be tuned in increments of 5 Khz to 995 KHz

FAQs:
1). Yes, this scanner picks up cellular telephone calls without modification.
2). No, it is not a good scanner for a beginner.
3). Yes, you can listen to the TV audio at work once the O.J. Simpson trial starts.
4). No it does not have a computer interface but I'll send you detailed instructions for a major modification that will permit computer control (no recommended for beginners).
5). Yes you can listen to shortwave radio stations but only really powerful ones.

Price is $375 with shipping. Email if interested to: michael@alexander.terranet.com

206. AMTRAK frequencies

Newsgroup: rec.radio.scanner
Date: 1995-01-07 00:08:09 UTC
From: jcovello@zcase.com
Message-ID: <01-06-1995.6147@sharon>
Source record: 263227

Does anyone have frequencies for scanning AMTRAK?
I plan to take an overnight trip and would like to bring my
scanner and see what I could catch. The trip originates in
Chicago and ends in western Colorado.

Thanks
Joe

207. Security in Trunking Systems (?)

Newsgroup: rec.radio.scanner
Date: 1995-01-07 00:41:40 UTC
From: Ki4je <vhealey@crl.com>
Message-ID: <3eko04$pjg@nntp.crl.com>
Source record: 263235

I ws scanning some data I downloaded a few months ago
and never read. I thought this was an interesting post.
I aplogise if it made it here already.

.....

I'm writing again about scanners because here in the City of the Miami Police Department, several officers have been SCREWED by the Internal Affairs unit and other specialized units for officers having police scanners in their vehicles.

First let me say one thing. In the State of Florida, it's not illegal for anyone to carry a scanner in their vehicle, which is "not permanently attached to the vehicle". The only ones exempt from that law are: Police officers, Amateur Radio Operators, and other emergency personnel. But as far as any citizen, they have the right to carry a portable scanner.

What has happened here in the City of Miami Police Department for their lack of knowledge, or plain ignorance, the high ranking staff has become concerned over the officers being able to monitor the activities of other units.

The City of Miami Police Department operates a S.M.R., A Shared Mobile Radio system, on an 800 MHz. Motorola type I, 20 channel trunking system. The system is shared with the Fire Department,Parks & Recreation, Sanitation, and Local Government. For those of you that are unaware, this means that no given frequency at any given time is specifically assigned to a given unit. You may hear police at one moment and the Sanitation department the next second on the same frequency. The scrambling procedure takes place by the Motorola's Central Controller, which assigns any available frequency to a given fleet, requesting access at any given time. I will not get anymore technical with Trunking, but I just wanted to give you all and idea.

Well here is what happens when you program your scanner to the 20 channels available, you only catch portions of different fleet conversations. But occasionally, particularly at night when only police activities are more active than others, you can here the conversations of the specialized units. This has infuriated the commanders of the specialized units. They were sold the concept by Motorola that Trunking was scrambled and hence could not be monitored by anyone. WRONG!

What has happened in the City of Miami Police Department, instead of these specialized units using encryption to secure their sensitive communications, they have now retaliated on any police personnel

carrying scanners. The department's commanders have issued reprimands and have blamed failed investigations against police corruption as a result of some officers having police scanners in their vehicles.

I feel this is real sad, when a department as large as the City of Miami Police Department has to lower themselves for their own ignorance and failures. They were warned many times that their communications were compromised long ago, but NEVER did they take any measure to protect them. Instead, they passed out reprimands, and scrutinize anyone who carries a scanner as a "counter-surveillance operative".

.....

What are your comments?

>Mike why did they pick up the AR8000?

1. It's a good scanner, manufactured by a company other than the one (Nissei) who made the previous AOR handhelds

2. They do not have to get them from ACE Communications now.

I bought mine from Marymac end of September (Grove was out then too)
Their phone number is 800-231-3680 in Houston, Tx. I ordered by
UPS 2nd Day for $8.00 and it arrived in Seattle the next day.
I understand that they no longer supply the standard version of
Scanstar software with it. To really make use of it you need Scanstar pro anyway @ $80.00
I tried a demo of Scancat pro, but it wasn't as easy to use as Scanstar.

Sorry to hear that kind of BS is going on. Here in Columbus, the city knew all along that scannists would be able to monitor the system, and they made the correct decision to encrypt all "sensitive" comms. The only things that are encypted here are Internal Affairs, Narcotics, Organized Crime, and a couple of tactical ops subfleets used for surveillances and so on. Some of the city personnel even make note of the fact on the air that their conversations can be overheard.

@SUBJECT:AOR operating hints/tips/tricks N
Hi all - I also own a AOR1000xlt and have a couple of obs: a. To the
question of how to defeat that blasted delay/hold
to make cell tracking easier, forget it!. This is a crazy
bug that exists in the op system of this radio. In my
opinion, this is one of the craziest ways to implement a
feature that would otherwise be very useful..... b. If you really want to
learn how to use this radio, buy
Howard Bornstein's book, 'Guide to the AOR1000'- I see
a new edition is listed by Grove (and by now, undoubtedly
others as well). LOTS of good info here for tips and tricks
on how to use this radio well.
c. The only other thing I did was to build a regulation circuit
for use when plugging the radio into the cigarette lighter-
I DID NOT want my radio to be smoked by a stupid voltage
surge! You can build one quite readily using a LM317T
regulator; the bonus here is that I now have a regulated
supply for ANY radio (center pin positive) that will run
between 2-14 VDC, and up to about 1.5 amp draw...

@TO :clough@javiaton.demon.co.uk N
@SUBJECT:AOR1000xlt variable squelch settings N
Hi Jonathan - I am a fairly satisfied user of the 1000xlt, but one thing
(well, really more than one...) that really irritates me is the fact that each
band range has its own squelch setting. Back a few years ago, I had an article
that said that there was a fix for this; however, a note to ACE in the US went
unanswered (no great surprise there...). Do you happen to know what this fix
is? That bug really limits the radio's usable sensitivity....

Roger,

The Nov/Dec 94 issue of Satellite Times had two good articles on the
space shuttle.

The first article, Space Shuttle Communications, lists S,K, and UHF
frequencies. The article notes that S and K band reception is most
likely impossible(narrow spot beams and multiplexed encoding). The
UHF is possible during overhead passes(used for EVAs and STDN ground
stations).

UHF AM simplex voice
primary 296.8 MHz
secondary 259.7 MHz
emergency 243.0 Mhz
EVA only 279.0 MHz

There is also the Shuttle Amateur Radio Experiment (SAREX):

FM voice uplink on 144.91, .93, .95, .97, .99 MHz.
downlink on 145.55 MHz.

The second article, Countdown to Liftoff, has a nice list:

Freq	Agency
125.65	Wx
143.80	Coast Guard
148.485	Timing/photo/status
165.1125	Command Post
163.4625	Cape Security
162.6125	Launch Support(Alpha)
164.00	Radiation Monitoring
164.75	Cap Nat'l Park Service
165.1875	Visual Surveillance
170.15	Base Comm/Press Support
170.175	Rail/Truck Ops
170.350	NASA PR
170.40	GSA
171.15	Maintenance/Fuel

>latter when I have the time.

Since posting this, I have tried installing additional shielding around
the RF stages on the main PC board. The results were mixed. The
shielding did reduce the amount of RF leaking in through the cabinet.
The reduction in strength of the images was quite noticeable (though I
wouldn't call it dramatic). Much of the cellular interference went away,
but the strongest 900 MHz pager images were still nearly full quieting.

The problem is that once I reconnected the antenna, the strength of all the
images came back up to nearly what it had been without the extra shielding.
Recall that without the shielding, I'd found that disconnecting the antenna
did not change the image signal strength. Apparently some image signal
energy had been entering via the antenna, but it wasn't noticeable because
more was getting in through the case. When the shielding reduced what was
coming through the case, the amount entering via the antenna suddenly became
apparent. A low pass filter in the antenna line successfully blocked the
offending 800-900 MHz signals while still allowing the desired VHF signals
through; but this solution does preclude scanning 800 MHz channels while
the filter is in line.

Unless the user were willing to put up with the inconvenience of using the
low pass filter and settle for partial removal of the images, I probably
wouldn't recommend this approach. The benefits don't seem to justify
the effort.

Greg

224. Re: AMTRAK frequencies

Source record: 263249

jcovello@zcase.com (Joseph J. Covello) asks
> ... scanning AMTRAK? ...
> The trip originates in Chicago and ends in western Colorado.

Amtrak uses the frequencies of the road on which its operating. Assuming
you're taking the California Zephyr, it would run over the Burlington
Northern from Chicago to Denver, then on Denver & Rio Grande Western tracks
through Grand Junction. Frequencies of interest would be:

BN 161.100 Ch 1 - Road & Dispatch
161.160 Ch 2 - Road & Dispatch
D&RGW 160.920 Ch 1 - Road
161.565 Ch 3 - Road
160.455 Ch 4 - Road

Additionaly, Amtrak uses the following:

Chicago 160.305 Commissary & Terminal Road
154.515 Union Station Police (also 472.3375 ?)
160.365 Amtrak / Union Station Police
Denver 161.550 Station Services

(Data is from The Compendium of American Railroad Radio Frequencies.)

>Ham Radio out of Canada which leads me to a few questions:

Good Luck getting it out of Canada. I've heard they stop them at the border.
BTW the BC855 supposedly can be restored. I've seen instructions for it,
but have not done the mod on my unit. Also any cell mods on Bearcat units
give you channel spacing that is NOT cell spacing (like the Radio Shack
units) If you do a cell restore on a Bearcat, you'll be able to receive
cell calls, but sometimes the scanner will be right on freq, but more
often it will be off-freq, sometimes a little, sometimes to the point of
distortion.

>3.Should a more expensive scanner pick up better than my 855
>[range doesnt seem very good below 100 mhz]

What are you using for an antenna? The built in whip is not a good
under-100 mhz antenna.

Correction: A poorly shielded scanner should be able to receive a signal
with just the BNC connector at the high UHF frequencies. Take a $99
scanner and put it next to a $1400 ICOM R7100; both with antennas
disconnected. I'm sure you'll find that the scanner hears the 490 MHz
signal better than the ICOM. Put the ICOM next to a $20,000 mil-spec
receiver with antenna disconnected and the ICOM will hear the 490 MHz
signal better.

>
>: That was the problem with designing radios that operate at those frequencies
>: is the ability of the signal to couple to just about anything.
>
>You're absolutely right; I have no problem receiving at those
>frequencies with no antenna...

Again, the problem is not the radio coupling itself to something else;
the problem is that the radio lacks adequate shielding to reject signals
entering through the case. In a best case scenario, all signals should
completely disappear when the antenna is removed.

Getting back to the original question, a gain type commercial monoband
antenna tuned to 490 MHz will definitely receive better on that frequency
than an all-band scanner antenna. In a mobile environment though, most
users probably would not notice enough difference to justify the expense.
Only if one were frequently straining to monitor marginally copyable
repeaters would the benefit be worth it.

: Since you don't get
: LAFD first call (as it is generally not put over the air), why bother.

:Quite to the contrary, We STILL do get first dispatch from LAFD and will for a while longer. We also have plans in the works for the time when LAFD goes to "Silent Dispatch" mode. But there are MANY more PS agencies throughout California and we have people monitoring them all of the time. We knew when the El Segundo refinery fire started (the other night) as well as many other incidents. It's not a case of there being too much news reporting of incidents, but being able to know what is happening out there and being able to choose what to report on. We have many RCMA'era on FirePage and they enjoy keeping in touch. The choice is yours. I do apologize if the notice was a waste of YOUR time, I have had e-mail from many people asking for more information. You must remember, the internet, as well as any other system, is a place of information and what you don't want, you throw away-- at least you had a chance to choose!

Go to HRO in Salem. Check out the Official Scanner Guides for MA and NH. (Actually, call first to see if they're in stock. 603/898-3750 or 800/444-0047.) Not cheap ($20-25 each) but they have everything and when you consider how much time and effort can be wasted looking for freqs, it's money well spent. If you want just police and fire, get the new (orange cover, not green) Police Call for $10 at any RatShack.

The real laws are bad enough. Why are you making up new ones?

The Communications Act of 1934 contains no such clause as quoted above.
Nor does any other US law. Sorry.

>for a given freq. of a crystal.

This model was very popular and I have 3 or 4 of them.
You can get the VHF-high band model to work from 2 meters through
174 MHz, but with reduced sensitivity at the edges.

The IF is 10.8 MHz and you can order the crystals from your
local Radio Shack store. It takes about one week unless
you order an uncommon frequency, like a federal channel :-)

From FAQ article I wrote, "Buying a Used Scanner Radio,"

[...]

The first scanners came in single band models, followed by
multiband models. As two-way radio users started to
populate the 450 - 470 MHz band, consumers were forced to
pay a premium for UHF scanner coverage. Some multiband
scanners, like the Electra's Bearcat III, required an
optional circuit board for each band.

[...]

Bearcat III (Electra): 8 channel crystal controlled
scanner. Requires optional front-end circuit board for
VHF-low, VHF-high, and UHF bands, but only 2 boards can be
installed within the radio at the same time. Two crystal
filters. No aircraft band coverage nor rescan delay.
Front mount speaker sounds good. Strong local oscillator
radiation often causes interference with other scanners in
the same house.

Flame Suit ON

Hello,

I own a Panasonic CORDLESS 900 Mhz phone & I have been VERY happy with it's performance. The model number is KX-T9220. I recently opened the phone to clean it & noticed there were a few adjustments that could be made. There seems to be some screws that can be turned to adjust transmit and receive. Like i said I'm more than happy with the performance, however when there is room for inprovement i am always looking for it. Since the warenty on the phone is no longer good, i was wondering if anyone knew of any mods that could be made on the phone to increase it's range.

This news group seemed appropriate enough to leave this message. I couldn't seem to find any others that would be better suited. Please excuse me if this is an inappropriate message for this group....

Thx!

244. PRO2006 attenuator switch - can't win

Newsgroup: rec.radio.scanner
Date: 1995-01-07 19:28:30 UTC
From: tango@teleport.com
Message-ID: <tango.21.0018FA0A@teleport.com>
Source record: 263268

The PRO2006 has a switch on the back to attenuate the incoming atenna signal by 10 db. If I switch to no attenuation, I overload on some bands and hear nothing. If I switch it on, I miss a lot of weak signals. A no-win situation. The problem is most noticible in the VHF range, less in UHF.

Suggestions?

Configuration: Diamond discone mounted 35 feet above ground, with a short run of RG6 into the second story of the house to the scanner. I'm in a suburb about 10 or 15 miles from downtown Portland, OR.

I'm glad that at least one person has gotten a TR-2400 that works!
So far EVERYONE that I have read posts from about the TR-2400 has
said that their unit broke rather quickly on them. I am currently
waiting to scrape up the $20 or so I need to send my TR-2400 back
for repairs. It was plagued by problems. When I got it, it would not
scan above 1600 MHz, the ac adaptor they supplied heated up the unit
UNACCEPTABLY (so I stopped using that) and finally after two weeks
the damn thing just died on me.
When did you order your TR-2400? was it very recently? I wonder if they
took care of the defects and now have 'workable' scanners for sale.
I'm thinking about getting them to swap it for a TR-4500 if they
don't have the same problems.
But the thing that REALLY pisses me off is that they sent me a defective
scanner and I have to pay the shipping to get it fixed. What assholes they
must have setting policy at ACE. (especially in this case where they KNOW
that all these TR-2400s are messed up).
Dave

REGUARDING THE LACKLUSTER PERFORMANCE OF RS DISCONE

I opted to add a vertical element as others did in this thread. I chose to use an antenna from the base of an old cordless phone. This helped dramatically in my loband reception. However, it seemed i was getting many episodes of cross-modulation (around 150mhz). After some more thought i realized I hadn't grounded the new vertical element so I just ran a slight piece of foil from the outside of the new vertical element (the shiny silver part; not the copper-colored lead) back to the metal on the discone. This resulted in a dramatic improvement concerning the cross-modulation. I also use a RS regular TV signal amplifier. Many say it is a must when using a discone but i haven't tried a non-juiced discone. Be sure that the ohms the amp runs at, matches the antenna. The model number of my RS tv amp is 15-113b. Also, add this amp. as close to the antenna as possible (vs. close to the scanner) With this enhanced RS discone setup i now receive police and ambulance from all over the Denver metro area from Boulder (20-30 mi?) with loband reception also dramatically increased. My old setup (2006) with whip was hardpressed to receive from outside of Boulder. Hope this helps someone :-)

Hi

I'm looking for a Diamond Discone model D130J.
Here in Vancouver, BC, there are two places you
can buy it. It's a special order item at both places.
Like everyone, I'm impatient and don't want to wait
4-6 weeks for delivery.

Anyone in my neck of the woods that's got one they
want to part with?

Please send your location/price to
gjacek@cyberstore.ca.

Source record: 263184

You can tune in MUZAK using your scanner. Try the 950-960 MHz band. It's not available there in all cities though. There will probably be 3 or more channels of music. Here's the plan in the Twin Cities area:

Top 40 959.9625
Easy listening 956.3375
Instrumental 956.3125

In some cities, you can hear Associated Press newsfeeds on this band, unedited!
One such city is Indianapolis. Not sure what the other ones are though.

Hi folks,
I'm looking to sell the following scanner:

Regency Touch K500:

Nice wood-like cabinet. Discontinued 40 channel
model with every feature Regency could dream of in one
scanner, except aircraft band. Idle tone bypass feature
for mobile phone stations works about 50% of the time.
Weather alert feature. Service Search in several banks.
Search and Store facility not implemented as well as
BC250, but better than none. Built in clock when radio
off or in manual mode. Can be programmed out of band.
Reasonable performance, but sensitivity could be
better. Spring contacts on membrane keyboard may need
soldering after prolonged use.

It works fine but I have no manual for it. Looking for best
offer.

I have a Bearcat 200xlt , I've just replaced the Ni-Cads in the battery case as they died a death , I've put in 750 ma/h batteries so it should last longer .
I find that the battery low warning comes on after about 4 hrs use , I remeber reading somewhere that there was a batch of units that had the wrong value Zener in the battery detect cct , and turned on to early .
My set works fine for another hour or so , but I have to turn it off , then on every ten minutes to reset the off timer.
Does anyone know the details of replacing the zener with the correct value ?

I sure hope it wasn't to the City of Seattle's Trunked radio system. I had a chance to observe it about 5 years ago when the Seattle Center people were trial users. The GE handhelds would hardly work. The Seattle Center would have been better served by installing a local repeater on the Space Needle for its own use.

I sure hope the death of the four firefighters didn't have anything to do with a 800Mhz system! I have a friend with Everett Fire, and he kept saying the administration wanted an 800Mhz Trunked system. (Because it was the latest and greatest.) I sent him an article from the Southern California Firestorms (Laguna Beach) showing that the Orange County 800 Trunkedd Repeater system failed miserably during that calamity. Regular and mutual aid
units had to get extra portables and use the sheriffs 460 freqs. Of course, by that time, it was a lost cause.

Sir, I was wondering if TAC was completely replaced with Air Combat Command, or is there now both MAJCOMs. (I'm mainly asking because I didn't see any patches for TAC at Clothing Sales). Same question for MAC and Air Mobility Command, ESC and AF Intelligence Command, and SAC and US Strategic Command.

If you could confirm whether those MAJCOMs have been completely replaced with the new ones, I would apprecaite it. Thanks.

Excuse my ignorance, but I learned in my antennas class a year ago that discones are basically a bent dipole in omnidirectional form that allows the incoming (or outgoing) wave to "find" its resonant length at some point along the radials in the disk and cone elements. End result, that the discone has a maximum frequency determined by the length of the elements.

So I'm kind of puzzled: if the elements are too short (frequency range is all above the cordless, therefore has a shorter wavelength), how could reception possibly improve for a lower frequency by _shortening_ the elements? You'd be making your equivalent dipole shorter, which raises the tuned frequency of teh antenna.

FWIW, it _is_ possible to build a discone that would reach down into the cordless range and below. It's just that the antenna would be quite large. (I posted a math-based note about cordless wavelengths and antennas a few weeks ago during a thread about building a directional antenna, specifically a YAGI, for the cordless frequency. End result: it's a big antenna. :-)

Excuse my ignorance, but my antenna class taught me that discones are a
bent, omnidirectional dipole which is (almost) frequency independent. The
useable frequecny range at the lower end is limited by the length of the
elements, as is seen in a typical dipole.

So I'm kind of puzzled: if the elements are too short (frequency range is
all above the cordless, therefore has a shorter wavelength), how could
reception possibly improve for a lower frequency by _shortening_ the
elements? You'd be making your equivalent dipole shorter, which raises
the tuned frequency of teh antenna.

FWIW, it _is_ possible to build a discone that would reach down into the

Hello
There has been much talk in this group recently on the subject
of frequency inversion scrambling and the hardware required to
unscramble it. I have just written some software which can both
scramble and unscramble frequency inverted audio that requires only
a PC and a basic sound card.
At the moment the program can't scramble/unscramble audio in real
time instead it works with prerecorded .wav sound files. So if you
record some scrambled audio from your scanner using any sound
editor program then save it with the name scramble.wav. Then type
"inverse scramble.wav" after a while the program will create a
file called out.wav which contains the unscrambled audio which can
be played on any .wav file player.
If a .wav file containing clear speech is put through the program
the out.wav file will contain the same speech but scrambled.
I have uploaded the program to the anonymous FTP site FTP.FUNET.FI
in the directory pub/ham/dsp under the name INVERSE.ZIP. This site
can be very busy so keep trying.
The program is not perfect as the output contains some distortion
but it is an interesting first which you might be interested in.

Please let me know what you think.

> number of banks (any 20 of which are avail).
>

I didn't read all your message before replying.
I agree with you here and that is my main use for it.
I went to alot of trouble to program 100 freq and text for N AL.
Later I deleted those banks for more Ga. programing.
I had to go to N AL yesterday and I found the stuff in a capture
file that I had made when dumping the AR8000. A quick trip to
WINWORD to cut the data and replace the ALPHA part of the address
which selects the destination bank and 6 seconds later the scanner
was programed again for AL by merely 'uploading' the file to
the rs232 port!
NEAT!

It even sound neat, makes a zipping noise as the scanner reads
all that data at 9600 baud. Zip ... all that tedious programing
is done.

Vic

They were sold the concept by Motorola that Trunking
>was scrambled and hence could not be monitored by anyone. WRONG!

WAIT A SECOND!!

I can just about guarantee that nobody at Motorola told them the that a trunking system is secure by nature!. In fact, Motorola is careful to inform Public Safety Users that even non encrypted Astro (in the digital Mode) is not considered "secure". Secondly, The Trunked Central Controller does not in any way shape or form,"scamble transmissions"!. Motorola does offer "encryption" for its equipment uses, but nobody at Motorola Ever would have made the statement that trunking by it'self is secure.

Once again, there seems to be a lot of BAD information going around about a lot of different types of communications system operations. Know what you are talking about before you make a STUPID statement like "The scambling procedure takes place by the Motorola's Central Controller". Congratulations you just made the #1 position on my 1995 uniformed stupid statements list!.

As far as the department cracking down on officers using scanners in their vehicles, that is stupid, as they could always record the channels at home and playback later. So it does nothing to ensure a solution to the problem, on top of the fact that this is a "knee jerk" reaction.

Hi,

The CU-8232 interface manual for the AR-8000 lists a command "SI." This command is described as follows:

"Set code for option ON / OFF. The SI command is used to review and select
the optional code unit On / Off if the option is fitted to the AR8000."

Ok, so who knows about this "code unit?"

HELP. I would like to place this on the ar8000.homepage for anyone to grab
as well as to iniate discussion on how to use it as well as set
a standard format for exchanging files. I don't have access to compuserve
and I hate uuencode files showing up in the mail as part of a message.

My ftp is read only to prevent hackers from harming it. Does anyone
know of a ftp site that would accept this information from Paul as
anonymous FTP?

Does anyone know how to salvage a uuendcode file that eudora has broken into
four parts when it retrived it from the server since the message was too large?

Would a large uuencode file travel as an attachment to a message
rather then part of the message? That way eudora may just download
the file acess.txt or whatever which I can uudecode by either
uploading it back to the unix host and running unix uudecode or
I could find a dos uudecode somewhere.

Any ideas. Jonathan scanned a color picture of the ar8000 for you
guys but I can't get the darn thing together to place on site.

Caution Paul. I believe that if you check you may find that only two
lines may be used for updating the data but if you try to access
the system eeprom you may find another set used.

I suspect that is why there are two physical positions on the
european interface to place the source and clone when sending
system data to another ar8000.The second postion probably
hardcwires a different set of lines. Note I accidentally managed
to jerk the cable and got it slightly crossed across the pins
inside the interface, it killed the 8000. Nothing! Pulling the cable out
brought the 8000 back to life. Pluging it back in killed it again.
8000 side. I yanked the cable out of the interface and noticed
the minor damge to the end. Fixed it and everything works ok now.

Also did you notice that when you plug in the cable and the ar8000
is on that it causes a hardware reset of the scanner's computer?
One or more lines may serve that purpose to guarantee a known
state when using the ar8000 and the interface.

How did you measure the signals on the cable?
Did you check to see if anyother activity was present
when you were executing the commnads to automatically send
data to the host computer when ever the squelch opened?

I would expect that any local Rat Shack casn give you that info. They have Police Call and their Radio magazine--both contain that info. If you really want to keep up with all of the Mass.-based freqs, get a copy of Scanner Master. 800-722-6701. I forget what I paid for mine--I think about $25 but it is worth it: 692 pages of freqs and useful info.

Brett Miller N7OLQ mailto:miller@ccm.ut.intel.com
Intel Corp.
American Fork, UT DoD#1461

URL= Uniform Resource Locator
HTML= Hyper Text Markup Language (or Links)

Just a footnote. I took Brett's excellent compilation and edited it
to make it more Internet friendly. How? URLS recognized by Netscape
and other decent web browses /newsreaders can be included in your posting
if you think carefully and follow a few rules. All the urls have a colon
in them. i.e. mailto: http: etc. Some require two to three slashes /
after them, then the information you are pointing to follows that.

Now if you read this message with say Netscape all those URLS
will show up in one of two colors depending on whether or not
you have used them in the last 30 days. What is nice also is
that you can click on save, give it a name like sources.htm
and whenever you use the load file option of netscape you can
instantly point to any of the listed places with the click of
a mouse and go there. No typing needed! You could even point to
that file as your homepage and use it for instant radio access.

I personally use the bookmarks saved as a html file as the
Home page on my local system, but that is another story.

299. Need help w/VOX & scanner

Newsgroup: rec.radio.scanner
Date: 1995-01-08 18:09:45 UTC
From: thawk555@aol.com
Message-ID: <3ep9p9$gvq@newsbf02.news.aol.com>
Source record: 263221

When I try to record from my scanner (220xlt) to my VOX (unknown brand) I get a strange stattic sound. The sound starts very quiet then gets progressivly louder untill you turn the squelch all the way down then back up. It goes away for appox. 5-8 sec. then returns in the same way.

I am running a patch cord from teh phones out, from the scanner; to the mic in, of the recorder. Is there a special type of patch I need to run.

300. Scan the 800mhz band with any scanner

Newsgroup: rec.radio.scanner
Date: 1995-01-08 18:40:08 UTC
From: hiyall@elvis.vnet.net
Message-ID: <3epbi8$sl6@elvis.vnet.net>
Source record: 263222

HOW TO SCAN THE 800MHz BAND ON ANY SCANNER!!!!!!!!

You can make your scanner tune the 800 mHz band by simply taking an old,
but working UHF TV tuner. Attach a 9 volt dc battery to the unit,
feed the output into the scanner antenna input jack and scan
from about 43 mHz to 46 mHz.
An antenna about 1 to 2 inches long on the 300 ohm plugs works fine locally.
The tuner needs to be set on channel 83.
Have fun!!! Happy scanning! Enjoy!!!

****

I downloaded the above information from a BBS in Charlotte NC .
I have no other information except what is written above....

Has anyone tried this or something like it?

Any one have diagrams / plans for an external adapter for scanners
to enable them to receive the cellular phone frequencies?
I understand there was such a thing until the FCC outlawed them...

May I caution you that I did not make that statement. This information
is from another source and I thought it interesting. The fact is that
the Motorola and other TRS are oversold to the local governemnts. Just last night
I heard one commander cry out that they better get this damn @#$% radio
system fixed before one of us gets hurt out here. TRS problems!

I know of one case that was published on a local bbs of an officer that
got fired because of what he thought was a private communication that
got tape recoreded by a scanner user and giver to his SO. I have no easy
way of confirming if that was true but I suspect it is.

The officers in the field are misinformaed by the reps that are supposed
to train them on the new system. They have high expectations that suprise them
when the TRS comes up short.

>Tom Altman
>Solon, Iowa.
>THawk555

Tom-
I recently got a VOX recorder for my scanner. I have a Bearcat
8500XLT. I also had that same problem. I was running the patch out of my
phones/ext speaker to the mic jack of the recorder. I found that, since
the output jack from the scanner was the phones/ext speaker line, it
emmited the low backround buzz that the speaker would. My VOX recorder,
after a couple of seconds, would pick up the noise and start recording if
there wasn't anything else making noise. I solved the problem by running
the scanner line out of the "LINE OUT" jack instead of the phones/ext
speaker jack. Also, my scanner has an AUX jack that, I later found out,
plugs into the recorders REMOTE jack & controls the recorder. (So really
don't need to use the VOX function.) Hope I was of some help!

The increasing sound is the recorders Automatic Level Control (ALC).

Your scanner output is to strong for the recorder input.
Buy a attenuator cable from Radio Shack.

I don't have the PRO-2006, but I have a question about it. Does it have cellular capability? My current scanner, for instance, is the BC 8500XLT and it has a special chip that blocks out cellular transmissions, or something to that extent. You guys that have the PRO-2006, does it have one of those, or can you pick up cellular calls with it? Thanx!

....

For what purpose? You could connect the audio output
of your scanner to the audio input (cut the microphone)
of a 49 MHz baby monitor through a DC blocking capacitor.

This is a simplified explanation of the scheme I documented
in my article "Convert Your Fisher Price Baby Monitor to a Repeater".

Voice inverted signals received by your scanner are then
retransmitted in the 49 MHz range, and the base part of
your cordless phone can hear them. If you luck out,
it will descramble them, too.

You spoted a feature they didn't think of.
I think a real time clock would have been nice as well as
a calulator and memo pad. Pushbottons are all there.

PL decode would have been an intersting feature also.

Also a simple algorythm to decode morse code and maybe fax as well
as the digital signals in the ham bands. Nice screen to display the data.

Maybe the next one.

Vic

Re: the problems accessing an alpha pager via computer:

Are you using an alpha page program to access the terminal? Some cannot be accessed without a program, some can.

Also, you need to know the stop bits configuration and the baud rate of the terminal his paging system uses. The normal default settings are 300 baud, 7-even-1. Even if his terminal will accept a faster baud rate, you are safe sending at 300 baud. If you don't know the rate and send at one faster than the one it uses your page will be rejected.

You must also find out if his system is password protected.

Finally, many systems use so-called ghost numbers, i.e. the pager's telephone number and the pin number are NOT the same.

Remember, the number you dial from your computer to access his pager must be the paging terminal's modem number and not the 7-digit number assigned to his pager.

I hope this helps. Any further questions, feel free to e-mail me and I or one of my technical staff will be happy to help you further.

John:

Most states exempt Ham radio operators from scanner in car laws.
The reasoning is thus: police radio frequency assignments are
often smack dab in the middle of the Ham bands. So a broad
intrepretation of the laws, without an exemption for Ham
radio operators, would put Hams that use their mobil radios
in legal peril.

The second reason is that police agencies have long recognized
the emergency communications capabilities that Hams have offered
them in time of need.

Hmmm. Motorola told Portland PD that their 800 system would never fail.
Guess what? It has, numerous times. Leaving all public saftey using
400MHz pac-sets. Florida has had a lot of problems too. So in thre
interest off selling their overly-expensive radios I can believe that
someone at Motorola would say it's secure. It may not be in writing but
they've made a lot of great claims with their system, but, their claims
have proven false---at taxpayer expense.

http://dice.dac.neu.edu/Homepages/paul/al.html

HERE IS THE PRO-51 CELL MOD:

There is an interesting test mode in the PRO-51 that, combined with the direct search feature of the scanner, lets you pick up out-of-band frequencies. You will have full access to the 66-88 Mhz ranges as well as the cellular base range of 869-896 Mhz.

Actually, there are several test modes in the PRO-51 (most of these comments should be true for any Uniden-made Radio Shack scanner, such as the PRO-46). I'll describe them first and then how to take advantage of one of them to get the restricted frequencies.

There are three data test modes. These modes completely destroy any frequencies you had programmed into your scanner, so it's best to use these techniques before you program your scanner. If you have already programmed it, you'll have to decide if these new capabilities are worth reprogramming.

Test mode 0. Clear the scanner.

A well-known method of clearing the scanner to all zeros is to hold down the 2 key, the 9 key, and turn on the scanner. All frequencies will be lost.

TEST MODE 1. Fill channels 1-25 with test frequencies.
Press the 2 key, the 9 key, the L/Out key, and turn on the scanner.
This fills channels 1-25 with these frequencies:
1 30.050
2 40.840
3 49.900
4 138.150
5 162.400
6 173.225
7 406.875
8 453.250
9 511.9125
10 108.500
11 118.800
12 127.175
13 135.500
14 66.450*
15 76.825*
16 87.425*

17 157.800
18 482.3625
19 29.000
20 54.000
21 806.000
22 857.200
23 888.96*
24 911.50
25 954.125

* indicates not within the PRO-51's normal coverage. More on how to use these in a minute.

TEST MODE 2. Fill channels 1-17 with test frequencies.

Press 2, 9, Manual
It fills channels 1-17 with these frequencies:
30.00, 40.00, 50.00, 140.00, 155.00, 170.00, 410.00, 460.00, 510.00, 54.00, 109.00, 118.00, 127.00, 135.00, 810.00, 860.00, 950.00.

There is also a display diagnotic mode.
Display Test Mode.

Press 2, 9, Band or 2, 9, Moni.
This put the display in test mode. Every annunciator and every digit element is turned on in a scan from the left side of the display to the right. To keep this test mode continuous, release the buttons before the first scan finishes. This mode does not affect stored memory. Press any key to exit this display mode.

Now, if you've decided to try test mode 1, you will find several out-of-band frequencies stored in your memory channels. Channels 14-16 hold frequencies in the blocked out 66-88 Mhz range, and channel 23 holds a frequency in the blocked out cellular base range. Once you have these frequencies stored in a memory channel, the PRO-51's direct search feature will let you search though these ranges. In the cellular band, the scanner searches in the correct 30 Khz steps.

You don't have to keep these frequencies in these channels. You can move them to any channel in the scanner. First move them to a monitor channel. While on a channel with one of these frequencies, open squelch completely. Press direct search button, either up or down. The direct search button puts the scanner into search mode and the open squelch holds the frequency. Then press the Monitor button. The frequency is now in the monitor channel indicated in the display.

Now you can move it to any regular memory channel in the scanner.

Enter the channel number
Press PROG
Press Monitor
Press the number of the monitor channel if the proper channel is not displayed

Press E(nter)

The frequency is now permanently stored in the memory channel. You can do a direct search from this memory channel at any time.

The 66-88 Mhz range mainly covers TV audio. However, there is a strange phenomenon concerning TV audio and the PRO-51. Channels 4, 5, and 6 audio fall within the 66-88 Mhz range, yet the PRO-51 will not pick up the audio frequency while searching in this range. However, TV channel 2 audio is at 59.75 Mhz. When you add the intermediate frequency of 21.6 Mhz, you get an image of the TV channel 2 audio appearing at 81.35 Mhz. This does come in, although raspy, since the PRO-51 is receiving in narrow FM mode while TV audio requires wide band FM mode for proper reception.

I have not tried the above mod yet, but since I just bought a PRO-51 I will soon try it. The reason I posted this is to hopefully get responses containing other PRO-51 software mods. Thank you very much for everyone's help and I hope you all can find the above mod useful.

Does anyone have any frequencies used by security, concert staff etc. at the ROLLING STONES CONCERT?

It is coming to Australia soon and I would like to be prepared. I only want frequencies that are used at ALL concert locations, NOT private security firms/companies that are hired for each seperate location.

Any ideas? They must use some type of UHF handhelds during setting up and during the actual concert.

Cheers Matthew
matthew@hal9000.apana.org.au

PS Could you please email me!

332. Is my Pro-2006 broken?

Newsgroup: rec.radio.scanner
Date: 1995-01-09 02:36:26 UTC
From: starin@netcom.com
Message-ID: <starinD249wq.n0w@netcom.com>
Source record: 263150

I normally receive the police on 476.4125 Mhz. Fine. Okay. Now, I can hear the same dispatcher on exactly twice this frequency, at 952.8250. I thought that Images were not EXACTLY twice the frequency. And, additionally, isn't the Pro-2006 supposed to be immune to images?

Anyone else have this problem?

Thanks

>could be made on the phone to increase it's range.

If you're happy with the performance, DON'T change those adjustments !
If you want more range, try substituting another base antenna that is
exactly twice but not more than exactly three times the original length.
And always get the base unit as high as possible.

I'm looking for some good frequencies to load into my scanner,
particularly police & fire, for Marin County.

I do have a copy of Police Call for California, but it lists _so_ many
frequencies - which are the active ones?

Please respond via e-mail.

Sounds like you are hearing the second harmonic, which is a weaker signal
at exactly twice the fundamental frequency. It is not the same as an
image, which involves adding or subtracting the IF.

The 2006 (which isn't made any more) doesn't receive the cellular
bands as sold, but can be modified to in a few minutes by removing the cover
clipping a diode.

343. Toronto 800 MHz Band

Newsgroup: rec.radio.scanner
Date: 1995-01-09 06:39:44 UTC
From: bl058@FreeNet.Carleton.CA
Message-ID: <D24L69.6zu@freenet.carleton.ca>
Source record: 263162

This may seem a bit elementary to some in this area, but it seems like a good place to post these questions.

A friend :) recently modified his Radio Shack Pro-46 scanner to open the cellular band, with 30 KHz stepping from 824-896. He discovered a couple of things. First, the cellular band in Southern Ontario doesn't seem to end at 896. Cell calls can still be heard up into the 900's. This differs from the info seen in recent listings. We also can't seem to nail down any specific range for the cellular 'base' frequencies, which give both sides of the conversation, instead of just the caller's which is transmitted from the mobile. Can anyone here give some insight as to how the cellular band is set up in Southern Ontario these days?

Also, there seem to be Toronto cops broadcasting within the cellular band, but they don't seem to be right on the 30 KHz steps defined for the cell phones. Now I had heard Metro's finest would be using a trunked system in the 800 MHz band. I thought a trunked system meant that the transmissions would continually jump between frequencies, making it nearly impossible to follow the action. However, it was possible to follow one incident on the DVP at approximately 884.010, which didn't move off that frequency for as long as it was monitored, about 20 minutes. Can someone explain how the Metro police are set up now? Is there a frequency list available? Is it worth defeating the 30 KHz stepping from 824-896?

Also, is there a new version of Scantrix available that reflect these and any other recent changes, and if so, can it be found free somewhere?

Thanks!

352. AR8000 interface pin-outs

Newsgroup: rec.radio.scanner
Date: 1995-01-09 15:51:34 UTC
From: petef@xetron.com
Message-ID: <D25Apz.5pz@xetron.com>
Source record: 263026

The AR8000 interface (accessable via. the battery compartment) appears to be as follows:

GENERAL COMMENTS:
Reference Pin #1 as on the left as viewing the radio back with radio standing on table. The connector is a 7 pin flex-print female connector with 50 mil (0.050 inch) spacing. Standard (source unknown, AMP Inc.?) flex connector strip would work (I made a connector out of 10 mil PC board and cut the connector traces with a modified Xacto knife and soldered standard ribbon cable to this connector). The connections are on the bottom side of the connector (ie. the conductors should be on the bottom side). The +5 Volt reference appears to be the battery voltage (4 NiCads at 1.25V = 5V).

UGLY REPRESENTATION OF BACK OF
RADIO'S BATTERY/CONNECTOR:

```
* xxx xxx xxx xxx *
* xxx xxx xxx xxx *
* xxx xxx xxx xxx *
* --------------- *
* :1 2 3 4 5 6 7: *
* _______________ *
*****************************
```

Pin 1 Active Squelch Indicator, OUTPUT, Source Z=1k ohm
0V=signal +5V= no signal

Pin 2 Line Audio Ouput, OUTPUT, Source ?ohms (DC blocked with capacitor)
+/- ~1 Volt peak audio (active allways regarless of squelch)

Pin 3 Ground, this is grounded to radio and battery ground

Pin 4 Ground, same as pin 3

Pin 5 RS-232 Receive Data, INPUT, has 1k ohm in series (Zin untested)
Levels (inverted RS-232 polarity) 0V and +5V (CMOS like)
Adapter needs to be inverted and level shifted to standard RS-232

Pin 6 RS-232 Transmit Data, OUTPUT, 1k ohm in series
Levels (inverted RS-232 polarity) 0V and +5V (CMOS like)
Adapter needs to be inverted and level shifted to standard RS-232

Pin 7 Vbatt source, OUTPUT (input?), RF choke in series
WARNING this pin will do unknown damage to the AR8000 if grounded
Unknown purpose and current load capacity
Voltage is Vbatt (~+5 Volt for charged NiCads)

DISCLAIMER (you knew that I had to put this in)

Use this information with care. The interface may not be accident proof and ESD protected. The RFI (Radio Frequency Interference) potential for incomming and outgoing signals is unknown. Exposing the interface to unknown programming commands will have unknown and possibly damaging operational changes to your radio. Your actual mileage may vary.

I have not tried any strange things to these lines yet. Let me and other AR8000 experimentors know how any of your experiments turn out.

The internal jumper and header pins appear to be manufacturing test points and have not been investigated further (on the IF board).

Naturally, the exemption from a state law must be in that state law. The
exemptions are there mostly because the state laws may violate the
constitutional ban on states trying to regulate things clearly 'reserved
for the Federal Government'. Because hams are more likely to know this
and raise objections, they have succeeded in getting the exemptions.

361. AR8000 - How to Modify BandPlan?

Newsgroup: rec.radio.scanner
Date: 1995-01-09 19:08:16 UTC
From: Glen Arceneaux <ddjgwa@arco.com>
Message-ID: <D25Jtu.Jz7@news.arco.com>
Source record: 263035

I am the proud new owner of an AR8000 and have been able to work my way through its operation reasonalby well - even to programming via a Mac (HyperCard)!

However, one thing that is still a mystery - the BandPlan defaults. Some of them appear to be incorrect. For example, in the 154 - 155 Mhz area, the mode is defaulted to AM!

Has anyone had successful experience with modifying the BandPlan? I realize that there is a potential to hose the AR8000, and I don't want to have to go through that learning experience!

Thanks in advance.

>was wondering, is MUZAK broadcast over sattelite(what freq do they use
>too)??
I don't know if the actual Muzak company uses satellite, however I know
that Marshall's (the clothing store--I used to work for them) gets the
music for most of their stores over a satellite system. The satellite is
also used for all credit card authorizations as well as their e-mail and
reporting system. I thoguht it was rather funny that if the music went
off in the store (i.e.--ice or snow on the dish) the computers went
offline a few minutes later.
As for the frequency, I have no idea. All I know is that the main
satellite transceiver was made by Hughes Newtork Systems, and there was
another decoder for the music made by AEI (I think they are based in
Washington state). As for decoding it..good luck. I believe the entire
system was digital.

Message-ID: <D25orH.Axt@boss.cs.ohiou.edu>
Source record: 263039
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Reposted with a lower price. (Original post was 1/7). Since I see that Pro-43's are not going for 250, the price is down to 210 + shipping (COD). Offers accepted....

ORIGINAL POST (with price change):

FORSALE

Pro-43 scanner. Don't know if its modifable (serial number wore off a long time ago). It was bought in December of 1992. Normal wear for a two year old machine (a few light scratches). Can e-mail more specs if you are not familar with the pro-43. Will include wall power supply and the 1995 Radio Shack Beyond Police Call scanner listings for all of the US of A. Wanted $210.

Reason for sale: want to buy a transmitting aviation frequency radio.

Eric

If you're going to spend more, do it to get triple-conversion, not more channels. More usually gets you more channels too of course, but triple-conversion is the "step-up" you want. Faster scanning speed is nice too (hyper-scan etc). -- Paul --

I am a ham and I consider the AR8000 the ultimate hand held
ham receiver. Just switch antennas and a ham can monitor any band he can
work up to about 2 gigahertz.

It would make a neat addition to field day!

My area has a lot of the between 450 and 451 MHz. You can hear all kinds of good stuff there. These frequencies are a good source of info about any late breaking news story. Just remember that the EPCA says it's illegal to listen to them.

I'm new to scanning but my friend just purchased the BC 2500XLT for about
$450. The new ones go for about $350. The price difference is because his
was old enough that it could be modified, the new ones can't. Ask before you
buy.

'Fraid so.

>I had
>a chance to observe it about 5 years ago when the Seattle Center people
>were trial users. The GE handhelds would hardly work. The Seattle
>Center would have been better served by installing a local repeater on
>the Space Needle for its own use.

Seems to be working a bit better now, but I have also heard of lots of
problems with trunked systems.

>I sure hope the death of the four firefighters didn't have anything to do
>with a 800Mhz system!

Apparently they have had problems with the trunked radios in the past, and
the issue was raised almost immediately by the local media as a possible
cause.

The fire dept claims they took care of the problems that had been previously
identified (not waterproof, emergency button too small were the ones discussed)
and that the radios had nothing to do with the deaths. There was some note
that they had some problems getting enough of the new radios to go around.

The FD does have an interest in not looking bad re the radios, but I believe
the decision to convert was actually made elsewhere and would think they
would have an even greater interest in the safety of their staff (if nothing
else, many losses would look even worse, particularly if they were the result
of a bad decision re radios).

The deaths (and the fire) are still under investigation. The firemen were
trapped when the floor collapsed under them. Why that happened is being
looked at closely, but it was a very old building that would not come close
to meeting current building/safety codes.

All of us in the Seattle area, and I am sure the country at large, are very
saddened by this loss of life. We join those who want to make sure that
all possible lessons are learned so that further deaths/injuries can be
prevented to the extent possible given the inherent risks that go with that
job. If it turns out to be a radio problem, then we need to either fix 'em
or replace 'em with a system that does work.

Don

>
>Brad
>
>

Brad:

If you are referring to the BC2500XLT, then you can get a "modification sheet" by sending $2 and a SASE to:

Grove Enterprises, Inc.
PO Box 98
Brasstown, NC. 28902
(800) 438-8155

Check the manufacturing date code on the back of the unit. Each of the four letters stands for a digit, with the for digit set meaning MMYY. All codes less than "ODID" (April 1994) are modifiable. (Remember that you are entirely responsible for the modification and misuse of the unit.)

Good Luck!

381. Re: What's this @ 119 Mhz?

119 MHz would be aircraft...and its AM, not FM...that's probably why
it sounds wrong listening to it with a FM radio (if you're using a
scanner w/o AM receive..)

From: mayor@pine.liii.com
Message-ID: <D264JE.n2E@liii.com>
Source record: 263055

Help - I currently own a Pro-46. I went to the Rat Shack looking to purchase another for a friend and they still
have some of the old style scanners besides the new 95 models left in the case.
When I asked the salesperson if they were the old ones that were still modifiable, I was told they had all been sent back to the factory for reconditioning and are no longer modifiable. Has anyone heard of them doing this or is it just the company line???

385. Comments on scanner antennas?

Newsgroup: rec.radio.scanner
Date: 1995-01-10 03:25:25 UTC
From: jblas@news.holonet.net
Message-ID: <3esun5$lft@colossus.holonet.net>
Source record: 263058

I recently purchased a Radio Shack Pro-43 and wanted to get some feedback on antennas. What do people think of the "cellular look-alike" mobile antenna? Also how about the discone and All-band ground plane antennas? It seems to me the All-band would be better than the discone for most things. Any comments and suggestions would be appreciated.

thanks,

Joe

> Thanx for your help,
> John Pape N0ZFT

Some state and municipalities have explicitly exempted hams from
their statutues or ordinances governing the use of mobile equipment
capable of receiving public service freqs. Some have done so after
lobbying from local hams and/or the ARRL. The argument for
exempting hams is most often based on federal preemption, ie., the
notion that federal regs. regulating ham radio have priority over
state and local laws in the same arena, because of the supremacy
clause of the U.S. Constitution.

As far as other "exemptions", because of federal preemption state
and local governments may not legally enforce antenna restrictions
that do not reasonably accomodate a ham's need for an effective
antenna system. (This does not apply to restrictive covenants in
deeds, since these are in essence private contracts). Likewise,
state and local efforts to regulate TVI are preempted by federal
law. Howvever, state and local governments, like individuals, often
ignore the law , and many hams have been forced into expensive
court battles to enforce their rights.

Otherwise, off the top of my head, I can't think of any other
areas where hams have enjoyed any special protection from state and
local laws.

I work for RS, and usually avoid commenting on the various subjects
related to RS since a lot of folks seem to enjoy bashing RS (whether
justified or not is a subject for another post). Anyway, here's what
happened:

After the April 1994 deadline for importing "modifiable" scanners passed,
several circuitry changes were made in some of the handheld scanners
(PRO-46 and PRO-51 are the ones that come to mind right off). Monitoring
Times (and I think some others) discovered and published new mods which
allowed additional 800 MHz access on these scanners. When Tandy headquarters
found out, they panicked and feared the wrath of the Feds for selling
scanners that might not be in full compliance with the ECPA. Rather than
risk a court fight, Tandy instructed ALL Radio Shack stores to immediately
pull these scanners from the shelves and ship them all back to Fort Worth.
We were not permitted to sell any of these models until they were
redesigned (again!) to prevent 800 MHz mods. I see that the January
issue of MT has yet another mod for the PRO-51, so looks like the redesign
effort was not entirely successful - if anyone wants a 51, they better
get it now before Tandy ends up recalling them again :).
To the best of my knowledge, the new RS scanners are not "easily
modifiable" - but sooner or later I'm sure somebody will figure out how
to reprogram/replace the chips. Guess it depends on how you define
"easily" and how much trouble you really want to go through.

Happy listening to all!

Mike, KB3RG

Well, tried to post this once before, but I think it bounced. Here goes again. This mod. is the only freq. mod. I know of for the PRO 39, but I haven't tried it. Use at your own risk.

Cellular mod for the RS Pro-39...

Keep in mind that if you decide to make this mod, all responsibility for any damage to the unit remains with you... If you make the mod within approx. one hour, you won't lose the frequencies already in memory.

You will need narrow solder wick, a small soldering iron, a small phillips screwdriver, a _very_ small phillips screwdriver, some needlenose pliers, solder.

1) Remove the battery lid and the battery pack.

2) remove the 4 phillips screws from the back of the Pro-39, and lift off the cover, which separates near the front of the unit.

3) There are two wiring harness connectors attached to the top PC board. Remove these carefully with the aid of the needle nose pliers, and keep in mind how the wires lead down to the bottom board (so you can route them in the same way on completion). Remove the 6 chrome phillips screws holding the top circuit board in place.

4) Unsolder the ground wire from the bottom right corner of the top board.

5) Unsolder the two wire connections from the BNC antenna conector at the board. There should now be just one connector holding the top two boards together. Lift the top board straight up to avoid bending the pins on this connector. Set the top board aside.

6) Remove the two chrome screws from the bottom corners of the next circuit board. One may be difficult to remove without the very small phillips screwdriver. Unsolder the ground wire from the corner of the middle board. There is a two wire connector

on the bottom board- disconnect this, and carefully remove the middle board.

7) Unsolder the four corners of the rectangular metal shield, and, noting its orientation for later replacement, remove it from the bottom board. Look for diode D-6, and carefully unsolder and remove it.

8) Put the Pro-39 back together again by reversing the above instructions. Take care not to pinch any wires against the case, and don't overtighten the phillips screws. Test the unit for cellular capability by setting it to scan between 869-894mhz.

: you're looking for cellular in the US one, forget it.

Jeff,

Perhaps you could give us the different part numbers for them -- so that
we would know which part to order from UK Tandy Parts to upgrade the scanner.

Someone I spoke to recently suggested doing the following:

Order Pro-2035 from Javiation in the UK, which comes with cellular.
Order Pro-2035 US power transformer from National Parts in TX.

Swap the transformers and there you have a full US-operational Pro-2035
with full cellular. Do you think this would work?

: Most Mods for the Pro-2004,5,6 should work on the 2035. (except celluar restoration)

The only mod I can see needed is the address, phone number for the UK Tandy
Parts depot and the CPU part number and price. Perhaps a little write-up
describing how to open and close it, and how to find the chip and change it.

Anyone seen one of each and compared notes?

[Don't forget, CPU chips are NOT a regulated item by the FCC, therefore, you
could import a large quantity from Tandy UK Parts for the express purpose of
marketing and retail sales in the US!]

Dan Stark (bl058@FreeNet.Carleton.CA) wrote:
: This may seem a bit elementary to some in this area, but it seems like a
: good place to post these questions.

: A friend :) recently modified his Radio Shack Pro-46 scanner to open the
: cellular band, with 30 KHz stepping from 824-896. He discovered a couple
: of things. First, the cellular band in Southern Ontario doesn't seem to
: end at 896. Cell calls can still be heard up into the 900's. This
: differs from the info seen in recent listings. We also can't seem to nail
: down any specific range for the cellular 'base' frequencies, which give
: both sides of the conversation, instead of just the caller's which is
: transmitted from the mobile. Can anyone here give some insight as to how
: the cellular band is set up in Southern Ontario these days?

The cellular frequecies for Cantel and Bell are as follows:

Cantel mobile 824.0400-834.9900
Bell mobile 835.0200-844.9800
Cantel cell 869.0400-879.9900
Bell cell 880.0200-889.9800
Cantel mobile 845.0100-846.4800
Bell mobile 846.5100-848.9700
Cantel cell 890.0100-891.4800
Bell cell 891.5100-893.9700

There ia agood explanatory article in the Haruteq Scanner Directory
(10th edition) that explains all.

: Also, there seem to be Toronto cops broadcasting within the cellular band,
: but they don't seem to be right on the 30 KHz steps defined for the cell
: phones. Now I had heard Metro's finest would be using a trunked system in
: the 800 MHz band. I thought a trunked system meant that the transmissions
: would continually jump between frequencies, making it nearly impossible to
: follow the action. However, it was possible to follow one incident on the
: DVP at approximately 884.010, which didn't move off that frequency for as
: long as it was monitored, about 20 minutes. Can someone explain how the
: Metro police are set up now? Is there a frequency list available? Is it
: worth defeating the 30 KHz stepping from 824-896?

Metro is on the 800 mhz band, though the frequency you show isn't it.
The ODXA Listening Post BBS has discussed this at lengeth, as well as
echoed the FidoNet discussion. Call the ODXA BBS at 905-841-6490.

: Also, is there a new version of Scantrix available that reflect these and
: any other recent changes, and if so, can it be found free somewhere?

Check out the files library at The Listening Post. It's there, as well
as a whole bunch of other stuff of interest.

Hello. This is Ronnie Dobbs of the Hastings UFO Society channeling to you by way of Madame Thelma on thePsychic CB Channel number 22, lower sideband, from an undisclosed location.

This is our Psychic CB Report.

First off, we would like to give our thanks to the gentleman who did that fine article about seeing the face of that Hippie from Venice in the Apparitional Home Page.

Madame Thelma says that she "feels" that his name might be Vince, or something.

As soon as we read that, the Society Think Tank held a Big Discussion about this and it was decided that they should have another viewing.

After thirty two minutes and forty five seconds of gazing, as timed on Communications Director Luther Atkinses Casio Digital Wristwatch which he got for Christmas, Think Tank Auxilary Reserve Member Harlan U. Blount said that that he could maybe see what might be the Face of Jesus, or somebody, and that they had "Scary Glowing Eyes".

Society Think Tank Spokesman Cecil Simms, always the skeptic, argued as to how could that be so because if those were glowing eyes then "what's that other glowing thing there".

Harlan allowed as to how it was probably one of Jesuses Nostrils with Light coming out of it.

Cecil then wanted to know as to how if that was so, then where was the other Nostril, to which Harlan responded that It was probably plugged up because of a sinus condition, or something.

Cecil disagreed and said that it was plain to him that it was the Holy Trinity, or something.

Harlan then challenged Cecil on the grounds that if he was so "durned" sure that it was the Holy Trinity, then would he be so kind as to point out just Which One is Which.

Much animated discussion followed, and Think Tank Chairperson Thyra Watson came into the room and announced that one of her Christmas Puppies from Daisy the Walker Hound, and her other dog Elvis (for more information about Elvis, please see the preceding article) had developed a "pigmentation pattern" on her nose just like in the

Apparitional Home Page, and added that this could "possibly be a Sign", or maybe even a "Miracle".

At that point, the Hastings UFO Society received an e-mail from Mr. S.P. Harvey in Chicago who said that he had made a pilgrimage to the Apparitional Home Page, and that he had not seen the Face of Jesus, but that he did think that he saw what looked to him like a man wearing eyeglasses, and that he thought it might be Bob Lazar.

At this point, the Hastings UFO Society has no answers, but our investigation continues.

We have also received reports that our Psicast Announcement has appeared TWICE on some newsgroups. Although we didn't send our message twice, we apologize for any inconvenience caused by that.

Luther says that skip might have been real good or something, and mumbled something about an e-layer, and then said that it was probably due to long, and short path propagation.

In addition, we have received reports that some people are having STRANGE EXPERIENCES when they try to retrieve some of our sound files off the Apparitional Home Page. We are told that it happens most often to people who are trying to do an anonymous ftp, and maybe takes the form of getting a wav file when you ask for an au file or something, but most folks who use Mosiac seem to be protected from this PHENOMENON as are people who do "plain vanilla" ftp, whatever that is.

We know that SCIENTIFIC EXPERTS are studying this as we channel this ASCIIcast, and hopefully will have an answer real soon as we don't know if this means that it does something better than normal or is something that needs to be fixed.

We will post an update as soon as we find out more information.
Zv
This concludes our report.

Thank You.

Ronnie Dobbs
President
Hastings UFO Society

NOAA Weather radio for Worcester is on 162.550 MHz. However, the weather data is transmitted from Taunton, MA, now. The Worcester tower is still manned until this summer but weather reports are generated in Taunton and rebroadcasted throughout Southern New England.

If you need help with any other freqs. around Worcester, let me know...

Hi Steve
Sent you an e-mail, but it had an error message...there are some
avid scannists in KC. I'm in ST Joe and have a big new KC
list if you want it.

It's that kind of activity, kerchuncking on federal and public
safety frequencies, that motivates those agencies to switch to
encryptic trunking systems that could eventually make the scanner
hobbiest an endangered species.

I know those pl tones are public record, but why post them here
and encourage illegal and dangerous activity?

Check it out!

The ScanWare BBS in Port Orchard, WA (near Seattle).

(360) 871-4591 (9600-28800 bps, 8N1)
(360) 871-4228 (1200+ bps, 8N1)

This bbs gives all callers immediate access to an extensive bunch of
files for down loading. Freq. lists and ham programs are a specialty.
Recommend you download FCC211.ZIP....the FCC Frequency Retrieval System!
This program cannot be beat!

421. preamps

Newsgroup: rec.radio.scanner
Date: 1995-01-10 20:18:33 UTC
From: achern@io.avl.umd.edu
Message-ID: <3euq2p$2dv@mojo.eng.umd.edu>
Source record: 263093

I listen to the local police in the 494 MHz area. In this county (montgomery) they use GE radios that have the A/B modes. When in B mode, they only transmit at low power (for close range car-to-car comumunications obviously). I usually end up hearing very broken parts of the transmissions, even if I temporarily kill the squelch. Would a preamp significantly help me pick up these transmissions? What are the disadvantages?

Oh, on a similar note: I've been looking at purchasing an AOR8000 and it seems to be flooded with features. Does it, by any chance, have any sort of build-in preamps (or equivalent) to help pick up weak signals? I guess this might defeat the purpose (PRE-amp), but maybe not.

Thanks for any help.

-Alex.

Michael Sawyer says:
" My father just got a Bearcat 2500 for Christmas, and noticed that the
" FAQ mentions that there have been problems. We were just wondering
" what the problems reported were with this unit?

One of the biggest is the poor battery life. 4-6 hrs at BEST...
Sensivity and selectivity are good, 400 channels are convenient,
programming is simple and straightforward.

I prefer to be able to select emission modes but use a different scanner
if I need a different mode than the Bearcat default.

Too bad they didn't provide for a "AA" battery case. The tradeoff in
available power would have been worth the extra size. Maybe they will
bring out a nickle-metal hydride to replace the Nicads.

There are also various "pro signs" which consist of two letters run together with no space. Some of the more commonly used ones are SK (..._._) which means the transmitting station is shutting down; KN (_ . _ _ .) which means "over", and BT (_ . . . _) which means "break". Many operators use BT to fill time while they are thinking, kind of like a morse "uhhhh", and many use it in lieu of punctuation at the end of a sentance. When a pro sign is written, it is usual depicted as the two letters with a bar over the top, ie...

__
SK

Hope this helps. You didn't say why you wanted a chart, but I hope you are not intending to learn morse code by studying a chart. By far, the best way to learn it is by ear, using either tapes designed for students, or software.

>to them.

Are you sure? Its been about a year since I looked at the ECPA, but
I don't recall any provision that would make it illegal to
merely *listen* to communications between a mobile and base station
engaged in news gathering. The primary impact on scanner owners of
the ECPA was its prohibition of intercepting cell phone calls.

" : >the rangers use. Again, life or death.

Not to detract from the other thread about "kerchunking" (which was RIGHT
ON... it really DOES piss off the feds!)

If you want to reduce part of the problem use a commercial grade
(type approved) radio for the ham band rather than a modified ham radio
on the pub safety band. then you at least reduce the charge of using
non-type approved equipment to, maybe, harmful interference and
transmitting without a license.

Remember the guy in San Diego County who broadcast on the S.O. freq to
request medical aid for a crashed mtn. biker with a severe head injury.
He was out of range of ham rptrs but was able to access the Sheriff's.
He had his radio confiscated and was facing possible criminal charges.
The DA decided to drop the charges when faced with public outcry.

I don't recall if the FCC stuck him with a fine or not. Anyway, he lost
he radio although hams in the area offered to replace the one commandeered
by the San Diego Sheriff.

" : Aside from the legal issues, which we thashed out a week or two ago, how are
" : you going to get the repeater frequencies? Most frequncy books don't
" : have the input frequncy or the CTCSS/DPL code, and even most of the few
" : that have them don't give you the correct pairings.

Guess you're using the wrong freq list...
Many of the California ones DO offer just that information. (and we
appreciate it VERY much)

Another option that I really don't recommend is to carry an ELT or EPIRB.
It may take a few more orbits of a satellite to pinpoint your location
but it would certainly bring a few folks within range of your handheld.
Maybe you'd want to try to talk to the CAP on 148.150 Mhz when they get
within range.:)

Uh... you didn't hear that from me :(

>
>.....Dave

Dave, in Indiana anyway the law brands use of a mobile scanner capable of picking up police signals a misdemeanor, but this section is followed by "This section does not apply to .... a person who holds an amateur radio license issued by the FCC." So hams in Hoosierland have blanket permission to run that 2006 in the car. ---Dan

Source record: 263105

IJ>Was in Radio Shack today and saw a Pro-43(discontinued) on Sale for $289.
IJ>The Salesperson claims this unit has been in the store for a long time,
IJ>perhaps June 94, so I'm not sure if it is one of the updated,
IJ>non-modifiable units. I pulled the following off the back plate hoping
IJ>someone can tell me if this unit is modifiable:

IJ>Model No: 20-300
IJ>Fcc ID: AA020-300
IJ>S/N: 07792

IJ>I believe there was a small sticker on the box labeled 1AF.

the model #20-300 and fcc-id uh (aa 20-300) are the same thing. the
serial/number means absolutely nothing.

now the 1AF is odd...being that Radio Shack uses that code as the DATE
code...on my pro-51, it says: 7A4, meaning the scanner was manufactured
in (7 = July) 1994. but i have no idea what the F stands for...never
seen it.

You've Got Questions. We've Got Answers.

I'm helping a friend shop for a new hand held scanner for her husband. I assume the more you pay for a Radio Shack handheld, the more features you get, ie. more frequency slots, faster scan speed, etc. However, is there some other major differences between the models that should factor into the decision, such as reported reliability, etc.? Please assume for the sake of this question that the feasibility of any type of internal mods is not a relevant factor.

Thank in advance for any help.

I have just purchased a PRO-43 (USA model) and have a few questions.
From the date on the service manual (1992), it's obvious these
scanners have been around for a while. If these questions have
been posted before...sorry.

Page 6 and 7 of the service manual refers to the 400 channels
that can be programmed. We all know 200 is the limit on this unit
out of the box. This reference to 400 channels makes me think
a mod may be lurking some where inside.

The schematic shows the keypad diode matrix for the USA/Canada,
and the Europe/Australia models.

20-300 20-9300
USA/Canada Europe/Australia

D1 USED | USED * connected to keypad/lock switch
D2 USED | Not Used
D3 Not Used | USED
D4 USED | Not Used
D5 Not Used | USED

We know by moving the D4 Diode from it's spot and placing
it in the empty D3 position we unlock the blocked 800Mhz, and extend
the 30Mhz-50Mhz up to 88Mhz. The tuning in this extended VHF low
area will probably be marginal because of different capacitors
and coils in the bandpass filter....But what about D2 and D5?
Has anyone played around with these to check what happens if they
are switched or removed?
From looking the schematic over it looks like the engineers purposely
crippled a 30Mhz to 999.9875Mhz full coverage receiver!
I am sure the marketing office showed them the necessity in doing
this so they could sell 10 different models!

>This fills channels 1-25 with these frequencies:

I tried this too, with no luck. The RS salesman who sold me my scanner said that they had to send all models back for modification so that this test mode would not be accessible (sigh). If I find any PRO-51 mods, I'll post them or at least direct people where I found them.

Happy scanning,
D. Moroder

Radio Shack is having an "unadvertised" sale on their PRO-51 model;
regularly $299.99...now $219.99. I just picked it up, and it does
everything I want and more. Check it out.

I bet it has been discontinued and they are trying to blow out current stock.
This is usually an indication when they do that sort of thing.
No flames etc aboput how you like the radio, RS is a business.
It hurts their sales to say an item is discontinued until they
have few left. Years after they dropped the 2004 some stores were still
trying to sell them for $74! In the right place they would be gone
because some loved that radio.

You could check by asking the clerk to look it up, the 2004 may still
be carried on their books somewhere, if so the store will still have it in the
database with a price. They can't get it but someone has it.

It sould be around $20 now.

I'm semi-new to the world of scanning and am finding all the discussion on this news group fascinating. I would appreciate help with two questions:

1) Information on scanning in off the shelf periodicals seems to be non-existent. Where is the best place to get general information on scanning?

2) Where is the best place to get information on modifications to the Pro-46?

Thanks in advance for any assistance.

448. Yupiteru mvt7100 vs AR8000

Newsgroup: rec.radio.scanner

Cross-posted to: alt.radio.scanner,rec.radio.scanner

Greetings all,

I'm looking into upgrading my scanner and I'm wondering if people here can enlighten me on the pros and cons of the Yupiteru 7100 and the AR 8000 (1000mem, rs232, handheld, right? I hope I've got the model right). The more technical you can get, the better it is for me. There's only about a $100 price difference between these models for me, so I'd like to make an informed decision. I've had both recommended to me, but no one has been able to give me any technical or feature data. I don't have WWW access, otherwise I'd check (?name escapes me)'s home page for info on the AR 8000.

If someone could post or reply email to me before this weekend, that would be great as I will be going to Akibabra this weekend (Tokyo's electronics market suburb). If I can find one of these scanner at a good price, I'd like to pick one up.

Thanks ever so much!

You can find the cellular mod for the BC8500XLT on pages 69 and 70 of the Sept/Oct 1994 issue of National Scanning Magazine (put out by the Bearcat Radio Club). The article was written by Steve Donnell, the same guy who came up with the BC220XLT cell mod (a very different mod, by the way) in the Jan 1995 RCMA Magazine.

I have a Pro2035UK and am using it with a 12v adapter. No need to do surgery with replacing power supplies if this method is acceptable.

Jonathan Clough just got the Service Manual and has the model number the UK CPU if you want it. Also, I'm having him check on a 30kHz mod, since there is a 30kHz indication on the right side of the display on ALL Pro2035s!

In regards to paging software: There are several good Windows version software available. Although they are somewhat expensive they are worth it. Notify, Winpage and Executive Page are a few that come to mind. Executive page does offer a shareware version thats available on Compuserve and all the other pieces of software can be ordered from a software supplier such as Egg Head or Comp USA. Most are around $100 to $130 but are well worth it if you send out many pages...

For Sale:

I have an AOR AR1000XLT handheld scanner for sale. It has 1000 memory channels and covers 500Mhz to 1300Mhz continuous (including cellular). It has not seen much use and is in great condition. I will include all accessories that originally came with it. I will also include a copy of Howard Bornstein's "Guide to the AR1000", which is a very comprehensive guide to the use of the scanner. I am selling it because I live in a place where nothing ever happens and having such a good scanner doesn't make any sense. I would like at least $300 (that includes shipping) for the scanner. Please email me with any questions.

Thanks!

>If you want to reduce part of the problem use a commercial grade
>(type approved) radio for the ham band rather than a modified ham radio
>on the pub safety band. then you at least reduce the charge of using
>non-type approved equipment to, maybe, harmful interference and
>transmitting without a license.

That certainly gets you around some (but not all) legal difficulties, and it would work. The biggest problem is that as far as I know there is no type accepted radio available anywhere which is very convenient for the kinds of things hams like to do. The type accepted radios I'm familiar with (primarily the Icom H16) will work but they are clumsy to program. If you go to a different area and need to change repeater frequencies you face a non-trivial task. They are useful for somebody who is both a ham and in search and rescue. If amateur radio is your thing they just won't do. (And they are more expensive than non-type accepted radios.)

In my opinion, if the only reason you want this is in case of emergency when you might want to transmit on a public safety frequency, then you would be better off using a modified ham radio. Such transmissions are allowed in emergencies although apparently there are government officials who don't like it so you may have to defend yourself. Just make sure it is a real emergency and that no other means of communication is available to deal with it. If you save a life you are probably OK. If the victim dies in spite of your efforts some jerk is likely to see if he can nail you. An available amateur repeater which you could have used is probably all he would need to get a conviction. Theoretically he could nail you even for saving a life if other communication was available. However a life saved goes a long way with any jury so you would have a good chance of getting off.

: the AR 8000.

From Victor Healey (Ki4je)'s home page:
ftp://ftp.crl.com/users/ro/vhealey/www/ar8000.homepage.html

The AR8000

Mailto:Clough@javiaton.demon.co.uk

The AR8000 is the result of AOR's long term ambition to produce a new
breed

of radio receiver which combined full computer compatibility with
advanced

wide-band radio receiver technology. With the introduction of the new

AR8000, AOR have broken the mould of conventional radio receiver
design.

At first glance the AR8000 in its static form may look no different to
any

modern hand-held scanning receiver, but the similarity ends
there...just as

soon as the receiver is switched on!! Initially you are greeted with
the

opening welcome message on the AR8000 multi-function liquid crystal
display

"WELCOME TO THE WORLD OF AR8000 RECEIVER", in a similar way to a sign
on

message displayed by your personal computer. This new experience
immediately

demonstrates to the new user and discerning radio listener that the
AR8000

is no ordinary radio but THE NEW CONCEPT in radio design. The modern
new

cabinet design measures approx. 152mm (h) x 69mm (d) x 40mm (w) excluding

projections and weighing only 350g including NiCads (but not aerial).

The AR8000 is a highly sensitive hand-held receiver boasting a very wide

frequency coverage of 500KHz to 1900MHz without gaps in the range (actual

acceptable frequency input from 100KHz). Step size is programmable in

multiples of 50Hz for smooth tuning. The all mode reception provides

AM,USB,LSB,CW,NFM and WFM. As you might expect from a radio receiver of this

calibre, an independent 2.0KHz SSB filter is fitted as standard and the

USB/LSB modes use true carrier re-insertion with correctly calibrated

frequency read-out (not offset by 1.KHz). A custom manufactured ferrite bat

aerial is neatly installed at the top of the receivers cabinet to enhance

receive performance when listening in population centres to Medium Wave

services or when commentary is provided at aishows and motor sport events.

The highly visibility LCD is of a new dot matrix format which enables many

new facilities to be used, many of which have never been seen before

especially on a hand held design. Two VFO frequencies may be displayed on

the LCD simultaneously, one providing a stand by frequency available for

quick transfer (similar to commercial aviation built-in radio transceivers.

When frequencies are entered, ALPHANUMERIC comments may be stored along with

frequency, mode & attenuator status simplifying the job or recalling and

identifying memory channels.

The LCD provides four lines of display so that additional facilities may be

provided and displayed at the same time, these include a signal strength bar

meter and a band-scope showing band occupancy.

The AR8000 is equipped with almost every conceivable operating feature but

operation remains easy thanks to a massive new microprocessor. A total of

1000 memory channels are provided which are divided into 20 banks, each

having 50 channels. AOR have chosen to allocate 50 channels per memory bank

(rather than the more conventional 100) based on findings that most radio

listeners prefer fewer channels per bank but more banks for simplified

operation. The AR8000 will search and scan at a very respectable (and fast)

maximum speed of approximately 30 increments per second. You may even enter

"special" frequencies into memory banks where they may only be recalled by

entering a user definable "PASSWORD"....this will stop preying eyes.

The AR8000 is truly a button pushers delight but operation need not be

difficult. As well as a comprehensively illustrated operating manual and UK

quick reference guide, the AR8000 has two operating modes: NEWUSER and

EXPERT. As already mentioned, the multi-function LCD provides many new

facilities but the receiver has a few more tricks up it's sleeve. Not only

can you connect the AR8000 to an external computer for remote control, you

may connect two AR8000 receivers back-to-back so that data may be copied

from one to another (small interface required for remote data access). There

are a variety of scan/search commands to link banks, scan by mode,

programmable delay scan, priority, auto memory store, step offset and a

programmable power save circuit to increase duration of operation from the

NiCads.

The mechanical assembly of the AR8000 will be a sheer revelation to any

radio engineer. Surface mount technology has been employed throughout the

receiver which is constructed of plug in modules. This will ensure the

highest levels of performance, reliability and serviceability. The AR8000

will certainly stand out in a constructional beauty contest. Keypad

illumination extends to the side panel keys and may be switched in a number

of ways. Illumination "permanently on" for mobile operation is possible. A

specially selected heavy duty regulator has been fitted to ensure the

receiver will continue to operate reliably even with the illumination

permanently selected.

MAIN FEATURES

Frequency coverage 500KHz - 1900MHz

All mode reception AM, NFM, WFM, USB, LSB & CW

True carrier re-insertion and specific SSB filter with non offset readout

1000 memory channels

20 search banks

Priority Channel

Frequency Pass

Rotary Tuning Dial

Step sizes programmable between 50Hz - 999KHz in 50Hz steps

Scan & Search speed up to 30 increments per second

Signal Strength meter

Band Scope

Backlit LCD , Keypad & side panel

Battery save facility

Separate controls for volume, squelch & dial

Attenuator

Keypad Beep on/Off

Keypad Lock

Top panel 3.5mm earphone socket

Monitor switch

Password protected banks

Programmable Scan & Search including Free, Delay, Auto, Level & Mode

Select Scan List

Clone (Copy) Data facility between two AR8000

Computer Control

Tape Output

EEPROM memory backup (no battery required)

Supplied with NiCads, charger, Hand Strap, Belt Hook & screws, earphone,

seem flexible aerial, DC lead with cigar plug

Comprehensive operating manual with over 50 illustrations & quick reference

SPECIFICATIONS

Frequency Range: 500KHz - 1900MHz

Receive Mode: AM, NFM, WFM, USB, LSB & CW

Step Size: 50, 100, 200, 500Hz, 1, 2, 5, 6.25, 9, 10, 12.5, 20, 25, 30, 50,

100, 200, 250, 500KHz or any multiple of 50Hz upto 999KHz

Sensitivity: 500KHz - 2MHz

SSB by field signal strength

AM by field signal strength

2MHz - 30MHz

SSB 1.0uV

AM 3.0uV

NFM 1.5uV

30MHz - 1.3GHz

SSB 0.25uV

AM 1.0uV

NFM 0.35uV

WFM 1.0uV

1.0GHz - 1.3GHz

NFM 1.0uV

1.3GHz - 1.9GHz

NFM 3.0uV

AM/SSB S/N 10db

NFM/WFM SINAD 12dB

Selectivity SSB 2.0KHz (-6dB) 7.5KHz (-50dB)

AM/NFM 12KHz (-6dB) 25KHz (-60dB)

WFM 180KHz (-6dB) 800KHz (-50dB)

Antenna Impedance 50 Ohm

AF Output (4.8V) 120mW (8 Ohm)

Power requirements: 4.8v NiCad / 6.0V Maganese / 9 - 16V DC external

Consumption: 150mA (nominal), 100mA (stand by), 20mA (Save)

Memory Channels: 50 channels x 20 banks = 1000

Pass Channel : 50 channels x 20 banks = 1000

Scan/Search Speed: Approx 30ch/per sec

Hope this helps.

-Alex.

469. Pro43 15 to 1000MHz mod. No Gaps!!!

We may be the only place in the nation to get your pro-43 modified to cover from 15 MHz to 1000 MHz no gaps!!!! Reduced sensitivity from 7 MHz to 15 MHz. Give that great unit a new life listening to shortwave broadcasts. Basically you would send the unit to us and we would send it back C.O.D. Currently we are looking at 5 working days to return it to you. We are posting this to see if there would be any interest in this mod. to the general public. E-mail me for any further details. Thank you.

>He had his radio confiscated and was facing possible criminal charges.
>The DA decided to drop the charges when faced with public outcry.

>I don't recall if the FCC stuck him with a fine or not. Anyway, he lost
>he radio although hams in the area offered to replace the one commandeered
>by the San Diego Sheriff.

As I recall, the FCC was totally uninterested in the entire matter - according
to even a *strict* interpretation of hte FCC regs, what the ham did was
legal.

All of his grief came from the SO. The SO (illegally) confiscated his
radio, harassed him, tried to have him charged. What they were
succesfull in was intimidating him. But, without a free attorney (like
the SO gets), he couldn't get his radio back.

Our government in action - what ever happened to that bill of rights thing?

>Many of the California ones DO offer just that information. (and we
>appreciate it VERY much)

>Another option that I really don't recommend is to carry an ELT or EPIRB.
>It may take a few more orbits of a satellite to pinpoint your location
>but it would certainly bring a few folks within range of your handheld.
>Maybe you'd want to try to talk to the CAP on 148.150 Mhz when they get
>within range.:)

Having found over 1,000 elts (almost all as a CAP member, Mission Pilot,
Ground Team Leader, Ground Operations Officer, Mission Coordintor, Wing
Ground Operations Officer, Deputy Director of Emergency Services, etc)
that's still not a good idea, for the reasons I said. There's no good
chance that (without an idication of a missing aircraft) that a mission
would get started - even more these days. If you're ever in Virgina,
stop in at the (new) Rescue Coordination Center at Andrews AFB ?

>Uh... you didn't hear that from me :(

Oh, yes they did. It just doesn't matter.

471. Date of Manufacture

Newsgroup: rec.radio.scanner
Date: 1995-01-12 03:44:53 UTC
From: scanware@myhost.subdomain.domain
Message-ID: <3f28jl$1nc@news.halcyon.com>
Source record: 262986

Here's the _word_ from Uniden on how to read the Date of Mfr Code found on the back of their scann

Example: ABLE = Feb 95

Only the SECOND and FOURTH letters of the code are significant.
That would be the _B_ and _E_ in the example shown above.

Second Character: Month of manufacture
A = Jan E = May I = Sep
B = Feb F = Jun J = Oct
C = Mar G = Jul K = Nov
D = Apr H = Aug L = Dec

Fourth Character: Year of Manufacture
A = 91 B = 92 C = 93 D = 95

So, if you just happen to want to collect _antique_ scanners
made before April of 94...look for anything before _xDxD_.

I know you probably get tired of seeing this announcement but...

I updated the pointers etc in the ar8000.homepage today.
I received two jpgs from Jonathan on the ar8000.The color one is quite
nice and shows the unit illuminated with its green lights. It displays
quite well with the final release version 1n of Netscape which is
available now. Netscape dosn't want their software mirrored of site
unless you are a college but I might put it in a nearby directory for
a few days if you can't hit their site do to traffic jams. You can
also run netscape without a winsock or net access just to view html
docs with a mozilla.dll I picked up. Let me know if anyone needs it.
This of course is pc stuff I am talking about. Netscape is also for the mac
and x-windows but you do have to go to the source for that. Netscape
is prohibited from many foreign countries do to
restrictions on exporting US software technology.
If you are on the state departments hit list don't even ask about it
I thought we were supposed to be at peace with everyone?

Two zip files from Wyman Chong. an easy to use access dbase and
a demo of a scanner interface program for the ar8000. The dbase file
came from compuserve library and is version ar8kdb11.zip. I looked at
an earlier version yesterday and I think it is right nice. The new file
is supposed to fix a macro that may not have worked correctly.

Michael Ayotte sent a new data file on the fm broadcast band ready to be downloaded
into two banks if you so desire, he also included a search data program for the same.

As of today all changed files and new files are noted in homepage with a date
so you can spot something changed that may concern you (
another suggestion from users of the ar8000 information).

I think that is all the new stuff for today. I has been fun putting it
all in one place for you.

73's
Victor Healey (Ki4je)

Send files and data to my anonymous incoming account via ftp at
ftp://ftp.crl.com/pub/incoming
then send a note via E mailto:vhealey@crl.com to move them to the

479. AR8000 hypothetical cell unblock

Newsgroup: rec.radio.scanner
Date: 1995-01-12 09:53:48 UTC
From: tharn@beringa
Message-ID: <3f2u7c$j7e@data.interserv.net>
Source record: 262829

Hi...let me propose a hypothetical way to unblock an AR8000 (US) for cellular.

Now let's just say "Collin" in London has an unblocked AR8000 with no gaps...and he downloads his entire radios bandplan into a file and posts it on the net...now let's say that "Skippy" in Seattle takes this file and loads it into his blocked radio...could he in fact "clone" his radio into an exact copy of "Collin's" radio? If this is possible are there any "Collin's" out there who would be willing to do this?

Just wondering.......

480. Re: Boy loses Girl on Scanner (Re: SCANNER PREVENTS MURDER IN TENNESSEE!)

Southern Boy says:
" So it turns out she is playing both of us and I couldn't deal with that. I
" don't know exactly how to deal with having that kind of information and I have
" considered getting rid of the scanner.

Hummmm, Bad idea... Kind'a falls in the realm oif "don't shoot the
messenger".

" On the other hand, this is actually
" information I need to know if she's just playing with me (I thought we were
" serious). Nonetheless, I broke it off with her that evening and we haven't
" seen each other since.

" I guess we are only breaking into some of the ramifications of
" telecommunications in the hands of individuals. At what point are you
" "checking up" on someone? There have been incidents in the news recently of
" people stalking others via e-mail, can one be guilty of the same by listening
" to cordless or cellular calls? Where's the line? I'm angry at her, but at
" the same time I feel guilty for having listened to her private conversation
" without her knowledge. I actually apologized to her for that and the way I
" handled it.

Now wait a sec. Let me get this straight. You date a lady (loosely
defined, of course). She's cheating on you with a married guy. You happen
to pick her up on one of the hundreds of channels. You feel like you've
been hosed upon. And then YOU apologise...

Get a clue! Whoever taught you to dump guilt in the wrong place certainly
did a wonderful job! Mistake No. 1, be *thankful* she's outta here. Good
ridance to bad rubbish. It would be one thing if she was tormented by
having to make a choice between two wonderful guys but it sounds like she
was dis'in you pretty good to the other guy. Smile, wave, and say Bye,
Bye to the B....! Have the scanner bronzed...

Organization: Public Seismic Network, San Jose, Ca.

" In article <kjnD2848o.Gy6@netcom.com> kjn@netcom.com (Ken Navarre) writes:
" >If you want to reduce part of the problem use a commercial grade
" >(type approved) radio for the ham band rather than a modified ham radio
" >on the pub safety band.
[snip]
" That certainly gets you around some (but not all) legal difficulties,
" and it would work. The biggest problem is that as far as I know
" there is no type accepted radio available anywhere which is very
" convenient for the kinds of things hams like to do.

Too true. They are MUCH less flexible than the ham radios that are
designed with convenience of channel switching in mind.

" The type
" accepted radios I'm familiar with (primarily the Icom H16) will work
" but they are clumsy to program. If you go to a different area and
" need to change repeater frequencies you face a non-trivial task.
" They are useful for somebody who is both a ham and in search and
" rescue.

Yep!

" In my opinion, if the only reason you want this is in case of
" emergency when you might want to transmit on a public safety
" frequency, then you would be better off using a modified ham radio.

I agree. If it is an *emergency* the FCC says (said) you could use any
means to communciate. Some agencies have taken exception to that...
Consider the worst that could happen would probably be loss of the radio.

" Such transmissions are allowed in emergencies although apparently
" there are government officials who don't like it so you may have to
" defend yourself.

Namely, San Diego County Sheriff and District Attorney.

" Just make sure it is a real emergency and that no
" other means of communication is available to deal with it.
Good advice.

Richard A. De Castro says:
RE: ELTs
" Having found over 1,000 elts (almost all as a CAP member, Mission Pilot,
" Ground Team Leader, Ground Operations Officer, Mission Coordintor, Wing
" Ground Operations Officer, Deputy Director of Emergency Services, etc)
" that's still not a good idea, for the reasons I said. There's no good
" chance that (without an idication of a missing aircraft) that a mission
" would get started - even more these days.

I don't know. They seem to keep you guys busy chasing down the ones that even show up in urban areas... like, in some pilots garage when he drops the box that contains the ELT and has neglected to take the batteries out. Or, around the airfield when someone tosses luggage against the TEST switch... I know if I have one and am down in the back country with no communication you can just bet I'll turn it on and hope for the best.

" If you're ever in Virgina, stop in at the (new) Rescue Coordination
" Center at Andrews AFB ?

Ahhhh, they finally moved out of Scott, eh? That was quite a place...

Message-ID: <249.796.352.0ND9E8FD@exnavy.esnet.com>
Source record: 262997

LW> I know that some states have passed laws that prohibit the use of
LW>scanners in an automobile. I have also heard from a couple of people that
LW>Amateur Radio Operators (HAMS) are exempt from all scanner laws including
LW>this law. Is this true? Is it a federal or state exemption? What other
LW>laws are HAMS exempt from?

The federal exemption pertains to TRANSCEIVERS that can receive out of
band frequencies, NOT scanners.

>spending
>more money for the 200 or 400 channels? Are there any difference in terms of

>coverage between 100, 200, and 400 channels?

>Any info is greatly appreciated.

I won't get into any specifics, but just let me say that you should buy
a scanner with BANKS. Usually they come with 10 of them. You can fill
one with police freqs, one with fire, one with state police, etc. The
YOU decide what you want to hear, and what you DON'T want to hear. I
have one without banks, and I'm continually locking and unlocking
frequencies, because if I don't it goes through them ALL all of the
time and it stops on stuff you don't want to hear at the time.

As I said, most come with 10 banks regardless of the total number of
channels. My Pro 34 has 10 banks of 20, my Pro 2006 has 10 banks of 40.
The extra 200 channels aren't as usefull as they would be if I had 20
banks of 20. I heard Radio Shack was coming out with one that has 1000
channels, you guessed it! 10 banks of 100. Oh well.

If the police in your area are in the 800 mhz band and you want to hear
them, of course you'll want one that covers that band. If you do this,
I'd suggest saving and buying a TRIPLE CONVERSION scanner. Otherwise,
those @#$&^%* cellulars will be bleeding in on the police freqs. My 34
is horrible in this respect. I suppose if you WANT to hear cellular,
this MIGHT be a plus!

>D. Moroder

There is no problem with posting frequencies, mods, etc. because they are public knowledge (i.e. not the creation of certain individuals). In the case of Mods, since some people spend a lot of time discovering them, it is always a good idea to post the source. If for example, you have Bob Kelty's frequency directory on floppy, it would not be proper to post that information as it appears on disk.

You need to remember where you sent the original subscribe request. There are a number of places that do this (mostly universities that come to mind). They are the ones that need to receive your unsuscribe message. Most likely it will require you to send an e-mail to a special address.

PS - Nice to know you're still out there. I hope r.r.s has some positive impact on Grove and MT.

> <g>).
>
> So, what are ALS and BLS?

You basically have the idea -- ALS (Advanced Life Support) calls are for any medical emergencies that might require the services of a paramedic or an EMT who can do ALS procedures (give drugs, start airways, use the defibrillator to shock a heart, etc). When a call even appears to have the potential to need ALS -- an ambulance or separate "fly-car" with a paramedic or ALS EMT is almost always dispatched. ALS calls include cardiac problems, breathing problems, pregnancy complications, diabetic problems, traumatic injuries such as MVAs and shootings -- like you said, anything life-threatening.

BLS (Basic Life Support) calls are non-life-threatening injuries -- a broken leg, "I've fallen and I can't get up", etc. This refers to the transport of the injured person, be it ALS or BLS. In many areas (like upstate New York) -- a volunteer ambulance corps will provide the "BLS" (basic medical care and transport to the hospital) and a separate vehicle will provide the ALS -- or they can be on the same rig.

Source record: 262738

Well, I've managed to hold off on a handheld new scanner purchase since I sold my Uniden 200XLT over two years ago.

I'm considering the AR1000XLT. How good a scanner is it considering the $400+ price (from Tucker)? Is the 1000 too dated already?

Also, the new Radio Shack line looks very "PLASTICY" and breakable.

What about the NEW Uniden handhelds? Bad intermod? Too many birdies??

Why doesn't anything look as rugged as the OLD Uniden handheld line? BTW, the AOR8000 is a bit too pricey for me.

Also, I saw the recycled Rat Shack PRO-51 back on display as an unadvertised special for $199.00. The sales droid said they were modified to eliminate the cellular workaround that everyone here already knows about.

ATTN: Radio Enthusiasts in the Worcester County area...

I am assembling people to form a local group that caters to various types of radio communication activities (scanning, shortwave listening, ham radio, etc.). This group, among other things, would help disseminate info about local frequencies and help newcomers with their questions. A regular newsletter publication is planned as well as a informal two-way radio notification system that will alert members to hot and interesting action happening over the airwaves.

I'm looking for hams, CB'ers, public safety folks, and anyone else who has an interest as well as anyone who wants to get started but needs more information. Needed are people who can ask questions, have radio-related problems or ideas, can contribute info, and/or share their knowledge and experience.

If you are interested in radio, whether an expert or a novice, please contact me and help form this local group. Let's get some local activity going so that we all get more enjoyment out of it!

THANKS!

> Such transmissions are allowed in emergencies although apparently
^^

Not so. Several amateur operators have found themselves in deep sh-t
with the FCC and local law enforcement after making emergency transmissions
in life or death cases. It's ashame but it's the law. Can't give everyone
the right to use public service frequencies, too great a chance for
chaos in time of emergencies.

If you want emergency comms, get a cellular phone cheap, or one of these
specials with limited service. Let the service expire (3 months to a year
depending on who the provider is) and keep the phone. Dialing 911 will
always work, whether you're subscribed or not. This is a result of legal
action several years ago during an emergency.

Why are you having difficulty accepting the fact that salesmen lie?

As the followup points out, and as I have experienced in several places,
everyone that *uses* (not installs/maintains/specs, mind you, tho' I bet
many in those categories are under the same impression) a trunked system
thinks that their system is totally unreceivable by mere mortals.
Fortunately, they're wrong.

The other funny thing is that the same folks think that if there are 20
talkgroups/fleets on their 5 pair system, then by god, there are 20
channels. True, in a sense, most of the time. But when The Big One (tm)
hits they soon find out what busy tones sound like ... :-)

Scanners Unlimited's phone number is (415) 573-1624.

The directory is called "Bay Area Frequency Directory" and lists many law enforcement, fire, and local government frequencies (like Public Works and Parks and Rec.) for the State of California and the following counties: Alameda, Colusa, Contra Costa, Marin, Monterey, Napa, Sacramento, San Benito, San Francisco, San Joaquin, San Mateo, Santa Clara, Santa Cruz, Solano, Sonoma, Stanislaus, and Yolo.

For each county, the directory lists county and city frequencies.

I bought the directory about 3 weeks ago but I don't recall the price.

I haven't tried the other freqs, but this one is still correct. In the last few days there's been quite a bit of traffic on that frequency.

I hear live helicopter traffic reports and radio weather reporters recording their unedited traffic reports that are later edited and broadcast.

Listening to this frequency is just about the best way to get up-to-the-minute traffic reports during your commute.

The bizarre part is having a 30kHz indication on the display at all! After all, aside from this country, where else do they use that step? Remember, this isn't the same display as on the Pro2006, so it wasn't like they just carried over the old display.

Yes, legal using in the car, if used on batteries and with a portable exterior antenna (hang on window type, not permanent mount!) Legal on a bicycle, legal in a boat, and can be legally carried in your hand.

519. Interference is Killing Me!

Newsgroup: rec.radio.scanner
Date: 1995-01-12 22:44:54 UTC
From: sjp117@psu.edu
Message-ID: <sjp117.8.2F15B0E5@psu.edu>
Source record: 262833

I am curious if anyone has any suggestions or experience with the problems I am having. I go to school in State College, PA. (very rural) and live permanently in Boston, Ma. (very urban). During breaks I lug my five scanners back and forth between states to keep in touch with my surroundings. My scanners include a Bearcat 760, 200, & MR8100 and Radio Shack 2004 & 2026. They are used in a combination of home and vehicle setups.

In PA my reception is good and interference is almost non-existent. Then again there isn't that much to monitor.

In Boston the interference is crippling. I live (straight line) less than 2 miles from downtown Boston and 1 mile from the Logan Airport Control Tower. My situation is this:

My VHF-HI (153-160) reception is interfered with by airport coms.
My UHF (460-470) reception is blown away by what seems to be pagers and news station trucks.
My UHF-T (470-490) reception is blown away news trucks and other businesses
My VHF-Lo (30-50) works fine, too bad only the state pd use it ;-)

Now I have figured out that I am often times getting the harmonics of 10.8 and 21.6 MHz, and that it is causing this problem. But why so terrible? It even happens when I take the antennas off the radio and run at full squelch.

The Pro-2026 filters out this problem best (assisted by 10db attenuator switch), but has annoying and loud squelch tail. The BC 760 works o.k. and slightly better with the CTCSS board. Sometimes the interference even gets by the CTCSS board and opens squelch. The BC 200 is worse and the PRO-2026 is horrendous, almost unusable above 450 MHz.

All of the radios are prone to short bursts of interference, sometimes analog, sometimes digital, sometimes both at the same time. Usually a rushing sound with tones and a voice. Driving by the airport sounds like a machine gun fight inside my car :-(

Is there any hope? How do agencies such as Boston Police and agencies around the airport avoid this interference? Are their radios that much better than scanners? Would low end proffessional radios work better than high-end scanners? Is there any hope short of encasing my radios in a lead display case?

Any suggestions, sympathy or comiseration appreciated?

Steve

P.S. How do you folks in NYC, Chicago and other big cities cope?

I keep telling people to *forget about the A in the FCC id* but some continue to use it, creating confusion such as yours. *All* of the FCC id's contain an A. The nonmodifiable ones have two--the A at the end of the id is what makes it unmodifiable.

A less confusing rule (I've been told it even works for Canadian units that don't have an FCC id) is based on the *serial number*. If the serial number contains an A it is not modifiable; if there is no A in the serial number, it can be modified.

: >good places to get freq's other than Rat Shack. Thanks!

I just found this book yesterday at the recomendation of my friendly neighborhood Ham Radio Outlet. It's called Scan Fan, and is published by ScanFan Publications. It was $18, but has lots of great information. It is organized by department and has some very good "insider" info. I have been very impressed so far, and a very high percentage of the new frequencies I programmed last night have been coming up today. If there is interest I will post (or mail) a more detailed review after I have used the book for a while.

Happy Scanning,

Doug

Not just the U.S. phone system, Canada too! Middle digit can now be any
number. That's why you now have to dial area code when dialling long
distance within your own area code.

Any of you know where I can get a good deal on a new or used AR-8000?
I live in California and _may_ choose out-of-state mail order to avoid
sales tax.

I called one mail order company in Dallas that sells them for $649
(US version), and a local shop in CA has the same price (plus tax).

Do you know any reputable mail order businesses that sell the AR-8000
or have you heard of better prices? What have some of you paid for your'.
I also want the RS-232 interface. Dallas' price: $110.

Thanks,
Randy Duran

Ian and I worked on this one via long-distance email. The utility works fairly well, although if you're
adept at DSP algorithms, you can probably improve it even further. But for what he was wanting to achieve, the results were pretty impressive to me.

Note that the utility inverts stored audio files, and thus will not invert in real-time due to the limits of
the non-DSP SoundBlaster. If anyone knows how to make a SoundBlaster do this in realtime, you
will have the proverbial better mousetrap, and the world may just beat that path to your door...

Brian,

OUr city too bouught the GPS sytem along with 800 Mhz units.
The new Chief decided that the GPS was not effective and stopped
replacement in the new cars last year. The City Council told him
otherwise. They said "We paid for it, and we're going to use it"
So 3 million later, we're still up and running.
Our 800 give very little trouble here. As a matter of fact, I
have been on a business sys. since 1991 here. It has failed VERY
FEW TIMES.
The problem is, whichever you buy be it GE or Motherola, once
it's yours IT'S YOURS!!! There in NO changing in mid-stream. I
thing that's why most of these cities are sold hard for the first
batch, after that you're at thier MERCY!
One more thing Motorola is good at.... Do you know that retail
price for a Trunked unit like you city buys is priced at $1295 to
the private sector and $2680 for gov't agencies? What a gouge...
That's why I love those guys so much....

Well, to make it short, it is a number (usually in groups of
five) channels that are shared and switched by numerous users so
that they don't receive or trasmit to other users on the same
channels.
The FCC says the minimum load for a trunk sys. is 70 units per
channel. Really just a high dollar busy channel lock out :)

534. Seattle/King County Trunk Freqs

Newsgroup: rec.radio.scanner
Date: 1995-01-13 01:15:06 UTC
From: dskidmo@halcyon.com
Message-ID: <3f4k6u$r46@news.halcyon.com>
Source record: 262848

I noted in a response to another thread that I would post what I have on Seattle and King Co. trunk frequencies.

It appears that Seattle PD/FD have largely moved to their new trunk system. The old 450/460 frequencies are lightly used. The FD is simulcasting their alarm tones and pages to medical consultants on medic runs. Fireground comms appear to all be on the trunk freqs.

King County (in which Seattle is located) has recently licensed some trunking frequencies, but do not appear to be using them yet.

Frequencies follow:

[1/95]

City of Seattle PD/FD/? Trunk Frequencies (Repeater)

851.0875 852.8625
851.1375 852.9125
851.1875 853.3875
851.3625 853.4375
851.4125 853.4875
851.8875 853.6125
851.9375 854.0875
851.9875 854.1875
852.1625* 854.2375
852.6375 854.3625
852.6875

*Has apparently been the control channel continuously for the time I have monitored so far. (Isn't this usually rotated daily (or hourly) in trunk systems?)

King County Trunk Frequencies (Repeater)

855.4625 858.4625
855.7125 858.4875
855.9625 858.9625
856.2375 859.2375
856.4625 859.4625
856.4875 859.4875
856.9625 859.7625
856.9875 859.9625
857.2375 860.2375
857.4625 860.4625
857.4875 860.4875
857.9625 860.9625

858.2375

NOTES:
1. I have yet to detect ANY activity on
the KC frequencies, but they *might* be the
frequencies intended for the county-wide
trunk system that was voted on several years
ago. On the other hand, it appears they have
only licensed one repeater per channel, to be
located in Enumclaw. Unless just the first
step or the system is actually to be used for
some other purpose, this would raise serious
questions in my mind about adequate coverage
throughout the county.

2. Though I have tried very hard to catch any
typos, there still could be some. Corrections
are welcome.

Enjoy!

Don

536. AR8000 Rx signal breakup

Newsgroup: rec.radio.scanner
Date: 1995-01-13 02:09:14 UTC
From: victors@world.std.com
Message-ID: <D2BnBF.6A7@world.std.com>
Source record: 262850

Hi,
I have been using my AR8000 for about a week now and like it a lot.
The only problems I have found are the following:

1. There is an annoying bug with the dial selector, sort of like
a badly debounced switch.

2. When listening to very strong signals, peoples words tend to get
chopped off near the end. Opening the squelch stops this from
happening, but it is annoying to have to constantly open and
re-adjust the squelch after a strong signal.
The attenuator doesn't do anything with this problem.

Anyone know of a solution for prob. no. 2?

Thanks

Vic

537. Monitoring Times - Where can I buy it? Vancouver Canada

From: knob@netcom.com
Message-ID: <knobD2BsI0.4r5@netcom.com>
Source record: 262854

Ok. After reading this newsgroup for a while, it seems that most of you guys are using the RS Pro series (pro43, etc...). I want to buy a scanner for all purposes, and want to make sure that it is modifiable (is this even possible anymore-today?), and has good reception.

I don't want to be limited by what I can or can't listen to, and sometimes getting the highest price thing doesn't always do the job. Is there a particular scanner out there (handheld or otherwise) that has:
-good reception
-good quality
-modifiable for cell/handhelds
-lots of bells/whistles and is widely available

I know this is a "newbie" question, but any information (opinions) would be helpful.

Thanks!

-Jeff <knob@netcom.com>

: #> laws are HAMS exempt from?
: #>
: #Scanners are a very cost effective way for a ham to monitor quite a few HAM
: #bands with a Pro-2004/5/6 they can monitor 11 meter up to the 70 cm bands.
: #Therefore a scanner could be a Ham rec'vr

: I was under the impression that the ham exemption was only for transceivers
: that could scan out-of-(ham)band frequencies incidental to their design.
: Most ham transceivers have a wider receive range than transmit range. My
: impression was that a ham licence did not automatically entitle you to
: slap a 2006 in your car with no transceiver in sight. Please correct me
: (gently, and with references) if I am in error.
: ....Dave
: Dave.G.Schwartz@Waterloo.ATTGIS.COM

The jury is really out on this as there hasn't been any real test case.
It is likely too, that a test case probably won't come up either

because in the few states that have automobile prohibitions for
scanners, each and everyone of those states already exempt hams
in the language of the individual state statute. The recent FCC
preemption does specifically state "transceiver" but the language
of the specific premption does not define exactly what a
transceiver should be in terms of the receive capability.

It's my contention that a reasonable case could be made that just
having a 2006 along with any single band mobile transcever would
"pass muster" if it ever got to a court. Frankly, given the
preemption alone, I doubt any prosecutor wants to wast his/her
time trying to get a conviction against a ham for having the
scanner...and at least today, the only possible way for the issue
to come up would be on a local (city, county or towm) basis if a
restrictive scanner ordinance existed on a local basis.

While 10-codes have not been dropped entirely they have BEEN DRASTICILY reduced in Washington Co. from ~ 100 to 13. The agency I am with used ~~ 20 before. (We were self dispatched, along with 3 other PD's, till E911.)

The previous Basic 911 center used codes for various events, these have all been eliminated. The basics is all that exist now.

Plain Lanquage dispatching is now the norm. Des Moines may also be using/headed to the use of MDT's for dispatch info. Another IA area is presently implementing MDT's at this time. Full use for dispatching, license checks in the future.

Here's an interesting idea. The city of Des Moines, IA PD has dropped
all 10-codes, signal codes and other assorted non-plain language xmits.
They've even discontinued (horrors!) 10-4!! (What would Broderick Crawford
of the old Highway Patrol TV show say?). Some patrolmen are now saying
"roger" - some say "copy" - haven't heard "acknowledged" yet - and esp.
no "QSL's" yet. Drunk drivers and pedestrians are just that - a violator stop
is a traffic stop - meals taken on duty or off are given in the clear.
Apparently the Asst. Chief (responsible for the patrol section) got
the Chief's approval for the change. Even the dispatcher's (some have been
with the city for quite some time) are saying "copy" for 10-4.
Does anyone know if any other jurisdiction has done this? It is an
interesting turn, to say the least.
Des Moines PD is on UHF 6-channel voting-repeater system. None of the
other metro agencies has made any changes as yet.

: : in advance for any help.
: --
: opp@netcom.com
I have the 440 Mhz version, the 4sra.
It works quite well as a 440 transceiver, but not quite as well as a scanner.
While the receiver is continous coverage, the performance varies
depending on the frequency.
The unit is rather intermod prone.
The supplied receive antenna is only useable on UHF and above.
below that, the performance is HORRIBLE!
Worse, Since Icom wanted to use the same basic chassis as the W2A, they
used a 1/8 jack for the scanner antenna..so no standard BNC based antenna
will fit.
While you can get BNC to 1/8 adapters(Hosfelt Electronics has them),
these eventually knock the jack connections off the PC board inside the
radio(I've had to resolder mine already)!
On the positive sides...
1.continous coverage(but see above)
2.every frequency step you might need(including 30 Khz)!
3.full CTCSS(PL)decode(and if you know how, you can use the radio to FIND
PL tones as well).
One cute thing about the 4SRA, you can extend the receive side of the
transceiver side, thus allowing receiving 2 UHF signals at the same
time(on the 2SRA, you can do the same thing, but for 2 VHF signals).
Like most Icom 440 gear(except for the NEW ones, the 440 side receives
800-900 quite well, and has all steps from 10 to 50 Khz(again, INCLUDING
30 Khz)
In other words, you can listen to 2 Cell calls at the SAME TIME!
When you find a good one, you can listen, while looking for another one!
Any other questions, ask away!

> I tried to send a message by calling the access number and modem
> (it answers and I do connect), I can't. At his work, there's a
dedicated
> Motorola machine for sending messages to staff with the new pagers.
> Anyone know what's missing here?

You've received some decent answers, but let's build a bit on the oe that suggested setting up your modem for 7E1 and 300 BAUD. In addition to this, try shutting down all the error correction and compression features of your modem (all the neat things you bought your modem for <grin>) so that it won't try to train. By the time it trains down to 300 BAUD, the paging terminal will have dropped the call. In addition, when you get a carrier detect and connect, send a few <CR>s .. the system should come back with 'ID='. If it does, answer with a 'M' for 'M'anual and follow the prompts from there.

An easier way of doing things is, as has been pointed out, through the use of a dedicated alpha page entry program. For a relatively comprehensive list of available commercial and shareware apps that we (read 'I') know to be available to do this, try our freebie Motorola Third Party Referral Guide to Alpha and Data Paging. You can get a paper copy of this through our NewsStream/NewsCard hotline at 800.542.7882 .. latest edition is the ComDex 08 Nov 94 one.

562. Wanted: Pro-30 Mods

Newsgroup: rec.radio.scanner
Date: 1995-01-13 14:26:27 UTC
From: szinski@prairienet.org
Message-ID: <3f62ij$b7d@vixen.cso.uiuc.edu>
Source record: 262931

I've asked this once before and received no response.

Does anyone know of any mods for the Realistic PRO-30 scanner?
Any help would be appreciated!

563. Modifications to RS Pro2021

Newsgroup: rec.radio.scanner
Date: 1995-01-13 14:47:56 UTC
From: m16099@mwunix.mitre.org
Message-ID: <3f63qs$74h@linus.mitre.org>
Source record: 262933

Has anyone been able to get the modifications listed for a pro2021 on oak.oakland.edu to work?

The speedup mod (adding 15K in series to the 39k-ohm resistor @ R-147 for a total of 54K ohms) doesn't seem to do anything at all.

Clipping the diodes @ D44 and D45 does allow the cpu to honor the 68-88 MHz band and the 806-960 MHz band but the radio just receives static in these bands - it acts like it is receiving no RF.

Adding 10K resistors to IC8 @ pins 5 & 13 to the rf-enable sides of r112 & r113 doesn't seem to do anything at all.

Any ideas (besides buying another radio)?

Thanks,
Len Burton

564. Introduction to Scanning

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA. It
tells where you can buy your first scanner, what features
it should have, where to get it repaired if required, how
to get frequency information, and mentions a few scanner
clubs worth joining.

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, armored cars, trains, taxis,
airplanes, and buses are all equipped with radios and you
can listen to them. You can monitor the local sheriff and
fire departments to hear about events "as they happen,"
before the news reporters hear about them. Hostage dramas,
bank robberies, car crashes, chemical spills, tornado
sightings are all fair game. In a single afternoon, you
can hear a high speed police chase, Drug Enforcement agents
on a sting operation, and undercover FBI agents as they
stakeout a suspect.

How about listening to a presidential candidate discuss
strategy with his advisor from a 415 MHz radiophone in Air
Force 1, or a team of G-men protect him while transmitting
in the 167 MHz range?

Listen in the 46.61 - 49.97 MHz range to your neighbors
deal drugs over their cordless telephone, or as their
conversations are picked up and transmitted over the
airwaves between 49.67 and 49.99 MHz by their sensitive
baby monitor intercom.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the ECPA. A new law threatens to outlaw listening to cordless phones, too.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $7.50 from ANARC Publications, P.O. Box 462, Northfield, MN 55057.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 |

have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners almost always provide more audio than portables, and portables are usually more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 16 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to many scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are undesireable due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned

to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued | Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat | BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 | portables. A number of owners report problems with the | Icom R1 portable and the older Uniden/Bearcat 8500XLT base | and 2500XLT portable. The new Uniden replacement models, | the BC9000XLT and BC3000XLT, work very well and are my | current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 has recently been replaced by the 1000 channel PRO-2035. The portable Radio Shack PRO-62 is a good performer. All three models employ up conversion and are made for Radio Shack by GRE (General Research Electronics). Both GRE and Uniden make scanners for Radio Shack.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a spring shaped antenna, covered by rubber. Although it is small and tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801, can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to lightning strikes because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because it they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864. |

- The Ham Station, 220 N. Fulton Ave., Evansville, IN | 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Marymac Distributing (Katy, TX) sells Radio Shack scanners at discount, but charges a 20% restocking fee for returned merchandise. Telephone (800)231-3680 and (713)392-0747.

- Scanner World (Albany, NY). Telephone (518)436-9606.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu

oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. G & G sometimes buys old scanners, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, 2nd edition published by SMB Publishing, and available from Grove Enterprises for about $25. This single edition contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major

metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 6th edition is available from Grove Enterprises for about $19. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. It will likely disappoint experienced scanner hobbyists and is better suited for beginners. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works well.

Grove enterprises sells FCC license information on CDROM for $100. The fields are similar to PerCon's Spectrum CDROM, but the transmitter and licensee location are intermixed which makes query results confusing. The first release has problems with mistakes in the data and documentation, and I look forward to a new release to correct these shortcomings.

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

As I have already done for dozens of radio enthusiasts in several states, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, and produce a custom color map. I call this new innovation RadioMap(TM) service. It allows you to identify antenna sites (including paging and cellular phone cell sites) and visualize the transmitter locations in your neighborhood, near your office, at an airport, and other places of interest -- from VLF through microwave.

This is completely different from the limited maps displayed on the Grove Enterprises CDROM. Through a new licensing arrangement with a professional mapping company, RadioMap shows detailed streets, railroads, rivers, and cities. Ham radio stations are not shown as they would clutter the RadioMap. RadioMap includes key sheets which list frequencies, callsigns, and licensee names. In rural areas, ranges of up to 10 miles are possible, while ranges of 1/2 to 3 miles produce best results in urban cities.

I will produce custom color 8-1/2" by 11" RadioMap reports, suitable for framing or laminating, for areas in any of the 50 states. Send $19.95 for each color RadioMap, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an

unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern

states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

AOSC questions can also be sent electronically to:

rccons!aosc_hq@telerama.pgh.pa.us or
dave.marshall@f240.n108.z1.fidonet.org.
FidoNet: 1:108/240.0

AOSC also has a MEMBERS & EDITORS Scanner related echo, AOSCNet, distributed via FTN on 6 BBS systems, and via Internet Mailing list. For info on the ECHO only, contact:

R.E. Christian, AOSC PA/AOSCNet Founder
PO BOX 12763,
Pittsburgh PA 15241-0763.
FAX: 412-831-5860.

Internet: rccons!aosc_pa@telerama.pgh.pa.us
rccons!aoscnet_hq@telerama.pgh.pa.us
rick.christian@f220.n129.z1.fidonet.org
FidoNet: 1:129/220.0

To receive a file of info on the All Ohio Scanner Club via Internet send to: rccons!ftpmail@telerama.pgh.pa.us

In body: get aoscinfo.zip

This will send a UUENCODED info packet to you. The file contains an outline of the material you will find in the American Scannergram, the AOSCNet, and an application for membership. (Note: This file will not be sent back to *.fidonet.org addresses.)

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, most at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about

4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

The Command Post
attn. Kim & Ted Moran
6143 W. Touhy Avenue
Chicago, IL 60646

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for 1995. All meetings will be held on Saturdays at locations announced in advance.

February 18, 1995 - Westmont Police Dept.
April 15
June 17
August 19
October 14
December 16

Bring a notebook and your appetite.

For Sale:
Yaesu FT-530 Dual Band Transciever (extended tx/rx mods)
Belt Clip, Standard Battery, Standard Charger.

No Warranty. Radio checks out fine, works perfectly.

Special Bonus: Will recieve crystal clear cellular telephone tx.

Asking $325.00. UPS Blue COD Shipping included.

Steven Pellegrino (sjp117@psu.edu) wrote:
: I am curious if anyone has any suggestions or experience with the problems I
: am having. I go to school in State College, PA. (very rural) and live
: permanently in Boston, Ma. (very urban). During breaks I lug my five scanners
: back and forth between states to keep in touch with my surroundings. My
: scanners include a Bearcat 760, 200, & MR8100 and Radio Shack 2004 & 2026.
: They are used in a combination of home and vehicle setups.

: In PA my reception is good and interference is almost non-existent. Then again
: there isn't that much to monitor.

: In Boston the interference is crippling. I live (straight line) less than 2
: miles from downtown Boston and 1 mile from the Logan Airport Control Tower. My
: situation is this:

: My VHF-HI (153-160) reception is interfered with by airport coms.
: My UHF (460-470) reception is blown away by what seems to be pagers and
: news station trucks.
: My UHF-T (470-490) reception is blown away news trucks and other businesses
: My VHF-Lo (30-50) works fine, too bad only the state pd use it ;-)

: Now I have figured out that I am often times getting the harmonics of 10.8 and
: 21.6 MHz, and that it is causing this problem. But why so terrible? It even
: happens when I take the antennas off the radio and run at full squelch.

: The Pro-2026 filters out this problem best (assisted by 10db attenuator
: switch), but has annoying and loud squelch tail. The BC 760 works o.k. and
: slightly better with the CTCSS board. Sometimes the interference even gets by
: the CTCSS board and opens squelch. The BC 200 is worse and the PRO-2026 is
: horrendous, almost unusable above 450 MHz.

: All of the radios are prone to short bursts of interference, sometimes analog,
: sometimes digital, sometimes both at the same time. Usually a rushing sound
: with tones and a voice. Driving by the airport sounds like a machine gun fight
: inside my car :-(

: Is there any hope? How do agencies such as Boston Police and agencies around
: the airport avoid this interference? Are their radios that much better than
: scanners? Would low end proffessional radios work better than high-end
: scanners? Is there any hope short of encasing my radios in a lead display
: case?

: Any suggestions, sympathy or comiseration appreciated?

: Steve

: P.S. How do you folks in NYC, Chicago and other big cities cope?

Steve,
I would guess the problem is that the first IF in your radios is 10.7 MHz, which means, for example, the interference on 153-160 from airport coms is about twice 10.7 (21.4 MHz away)..so a strong "image" of the airport coms ends up on the VHF band. My bearcat 800xlt does this...IMHO these radios suck in terms of intermod rejection, because of the leaky and lousy conversion process. I have an Icom R7000 where the first IF is about 800 MHz, thus drastically reducing images.

As an example with this radio (R7000) I hear a pager frequncy on 152.21 that is 60dB+S9 ! (pins the meter) so 21.4 MHz down (130.81) the signal is barely heard. It pays to get a high end receiver in a high intermod environment.
BTW I do live near NYC and the R7000 runs circles around garbage like radio shack, bearcat etc. No offense :)

>
It has been my observation that the bigger the department, the less likely
they are to use codes. Unfortunately, the purpose of those code is to
make the transmission of information shorter and clearer. Most departments
use them to obscure things, often even from themselves.

It does have the advantage that they will develop interesting code words
in place of the signals. If you hear some cop say 'that's clear' or
'bump me' he's probably from Houston. And unlike cops from Dallas, he'll
be able to make the technical stuff work...:-)

>in life or death cases. It's ashame but it's the law.

I'm happy to say, you are wrong. My FCC rule book is home so I can't give you the exact chapter and verse but the FCC specifically allows these transmissions in an emergency. Furthermore, congress has given the FCC exclusive power to regulate radio transmission so this overrides any local laws to the contrary. If you insist I will look up the rule and post it.

I do remember one question from the novice exam. Something like, "In an emergency you cannot contact anybody on frequencies for which you are licensed. What do you do?" The correct answer given in all the manuals is something to the effect of, "Make necessary communications using any means available." We do have some stupid laws in this country, but at least here wisdom prevails.

It is true some local jerk may try to throw his weight around. In so doing he violates the law but he can give you a hard time. If you follow FCC rules the law will be on your side so if you get a competent attorney you should be OK. In the worst case you may have to appeal but eventually a federal judge will overturn any judgement against you. Of course if you violate the rules all bets are off.

>Can't give everyone
>the right to use public service frequencies, too great a chance for
>chaos in time of emergencies.

We should be very clear on the type of emergency. The above rule applies to the isolated incident. In a true disaster such as an earthquake or hurricane the FCC will take over certain frequencies and declare them unavailable except for emergency communications. Often there will be a controller on the frequency (especially if it is a repeater) who says who may talk when and tries to priortize these communications. In this case even if you have a amateur,

license, if the FCC wants your favorite repeater they get it. You better not use that frequency except for the emergency transmissions. Report a neighbor in need of quick medical attention, great, but don't use it to chat with your buddy.

>If you want emergency comms, get a cellular phone cheap, or one of these
>specials with limited service. Let the service expire (3 months to a year
>depending on who the provider is) and keep the phone. Dialing 911 will
>always work, whether you're subscribed or not. This is a result of legal

Good idea for areas where cellular coverage is good. While this coverage is expanding there are still large regions of the world and even of the US with no cellular coverage. Irridium will change that but it won't be cheap.

>> there are government officials who don't like it so you may have to

>> even for saving a life if other communication was available.
>> However a life saved goes a long way with any jury so you would have
>> a good chance of getting off.
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

>To be seen...

Agreed. If you violate the law you expose yourself. If that violation saves a life a compassionate jury may let you off but there is no guarantee. That is why I emphasized that before you make the transmission on the unauthorized frequency you should make certain that there is no normally legal means of communication you can use instead. If there is a phone nearby, or you could use the amateur repeater for which you are licensed, use one of those, not the police frequency. Only use "illegal" frequencies if

a. There is no other way to call for help, and

b. It is a bona fide emergency.

It seems to me that this rule is just common sense.

>a demo of a scanner interface program for the ar8000. The dbase file
>came from compuserve library and is version ar8kdb11.zip. I looked at
>an earlier version yesterday and I think it is right nice. The new file
>is supposed to fix a macro that may not have worked correctly.

I FTPed the 1.1 version & noticed a problem - I was unable to read in A00 & a00
(or any other such duplicate). The problem appears to be that the DB uses the
bank ID as the primary sort key, and does not allow "duplicates" to be in the
DB table.

As far as ASCII is concerned a00 & A00 ARE NOT duplicates, but unfortunately
ACCESS is doing a case insensitive sort & considering all those as duplicates.

Maybe the original author and/or some other ACCESS capable person can correct
that?

Thanks

Leonard

576. Ar8000 Problems!

Newsgroup: rec.radio.scanner
Date: 1995-01-13 21:10:08 UTC
From: Glen Arceneaux <ddjgwa@arco.com>
Message-ID: <D2D44y.FIu@news.arco.com>
Source record: 262944

I recently purchased an AR8000 at Tucker Electronics in Dallas. I discovered two annoying problems:

1. The BandPlan data for the unit was UK - based. This made the "Auto" mode virtually useless for me here in the States.

2. The dial selector appears to have a "bounce" problem, making the entry of channel annotation (and all entries from the DIAL) annoying.

I contacted Tucker Electronics, and they said that all of their units had the UK BandPlan, and that was that! When I called EDCO, the US distributor, they confirmed that as of today, AOR is only shipping the UK BandPlan units and they were not sure when they would get US units.

As far as the DIAL selector problem, neither Tucker nor EDCO was aware of a problem here, however, I did notice a posting from victors@world.std.com that indicated that he has experienced a similar problem. I will bring the unit in to Tucker tomorrow to see if I can get an exchange .

Is there anyone out there who can add any experiences, knowledge or speculation here?

Thanks in advance,

Glen Arceneaux (kg5mn)

Jim, as far as I know, you can use a scanner in your car as long
as it's not "perminantly" installed; ie: hardwired into the electrical
system, or mounted in the car. I don't know if any local laws are
different. Any place else is fine.

Happy Scanning... Greg

>If you're happy with the performance, DON'T change those adjustments !
>If you want more range, try substituting another base antenna that is
>exactly twice but not more than exactly three times the original length.
^^

What is the thinking here? I assume it is a quarter wave vertical, so
a halfwave vertical would have a much different impedance, while a
three quarter wavelength (three times the original length) would be
the same impedance as the quarter wave.

I would have said:

...exactly three times the original length but not twice the original length.

Mick

PS. - FCC type acceptance wouldn't hold if you changed the antenna, so
I am assuming you are using it as ham equipment.

>And always get the base unit as high as possible.

definately.

: I keep telling people to *forget about the A in the FCC id* but some
: continue to use it, creating confusion such as yours. *All* of the FCC
: id's contain an A. The nonmodifiable ones have two--the A at the end of
: the id is what makes it unmodifiable.

: A less confusing rule (I've been told it even works for Canadian units
: that don't have an FCC id) is based on the *serial number*. If the
: serial number contains an A it is not modifiable; if there is no A in the
: serial number, it can be modified.

Not to add fuel to the fire, but this doesn't go all the way for me. I
just bought a Pro-43 from Marymac, who assured me that it was
modifiable. The FCC ID is AA020-300, and the serial number is 050265.
It sounds from the above that mine is modifiable, but the AA in the ID
number makes me nervous. I also heard that a sticker in the battery
compartment has some significance. Mine has a sticker with "4A3" on it.

One other question, I d'led the mods from oak.oakland.edu, and am
wondering if there are any keypad mods for this unit. I am not so eager
to attack the thing with a soldering iron since it's brand new.

Thanks in advance for any assistance

Doug

One more suggestion, since this question comes up so often, perhaps some
knowledgable person could collect all the pertinent data, and post it
say, once a week? It might be worth it....

I would rather be a foolish optimist than a correct pessimist.

593. AR8000 leather case?

Newsgroup: rec.radio.scanner
Date: 1995-01-14 01:45:26 UTC
From: victors@world.std.com
Message-ID: <D2DGvq.Cwy@world.std.com>
Source record: 262959

Is there a leather case for the AR8000? Notice I said leather
not vinyl or leatherette (sp?). I've called a couple of dealers
that carry the AR8000 and ask for the AR8000 leather case.
When I press them to make sure it is leather they claim a real
leather case isn't available.
After paying that much for the AR8000 I want only the finest
Corinthian leather to shod my scanner.
Is the US$25 vinyl case all that is available?

I've received some email replies to my previous posts and there
does indeed appear to be a bug in the debouncing of the selector
switch. It's not that bad, just annoying. I can't believe
a bug like that could have slipped by.
Anyone have any info on possible firmware upgrades in the future.

Vic

That's why I hate FCC id-based rules. I should have written

All of the FCC ids contain As. The nonmodifiable ones have
three--the A at the end of the id is what makes it unmodifiable.

I'll try to fix my earlier post.

Yours is modifiable: No A in serial number. See how easy?
Also, 4A3 = April, 1993.

Its no big deal. It can be changed. There is in my files
a mesage from Pete Folley that he has already done so
an will be posting a program to allow you to make similar
changes shortly.

The occasional 'bounce' in the rotary switch doesn't bother me.
It is more convient then slewing buttons found on other radios.

609. Percom CD-Rom (How to hack it for its data)

Newsgroup: rec.radio.scanner
Date: 1995-01-14 12:16:00 UTC
From: ki4je <vhealey@crl.com>
Message-ID: <3f8fa1$edb@nntp.crl.com>
Source record: 262734
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I have the Percom Cd-rom and for the most part it is ok, but...

I hate the fact that it locks the temp.dbf file it creates
and hides in the c:\dos directory when it selects records to
display on the screen.To access the dbase on the cd with ms access
is not practical unless you want to devote a gig hard drive to the task.
I don't, that is stupid IMHO.

Hack one from Bob Parnass
Turn off the computer after Percon displays the records.
Reboot
You can deal with the file found in the dos directory since
Percon didn't get a chance to delete it. c:\dos\temp.dbf
Problem is I run several different os and multiple config in dos/win
plus there is some exotic hardware that must boot before I can even
access the hard disk boot sequence. Booting is too long a process to
do more then once a day!

Hack two Ki4je
Use windows without share.
You have to disable it in the boot and in the win.ini file.
Not easy if you don't know what you are doing.
MS access will not run if share not active. (Bummer)
Everytime a temp file is created switch to a file manager
and copy it to another location and rename.
Restore dos and win to proper configuration and run you dbase program
to manipulate the data.

Hack three Ki4je
Why didn't I think of this the first time around?
Run the percon program in win.and display your target data.
Escape back to main menu and let Percon do its nasty thing
of deleteing all its data hidden in your dos directory.
From another window run UNDELETE. HA HA You have it!
Move the files so they aren't overwriten in additional
searchs by percon's software.
This later way was necessary for me to figure out so I could avoid
alll the pain the first two ideas entailed.

Now if only someone could tell me how they got that percon cd-rom
to work under OS/2 Warp. Anyone?

The NY State Police (and a few other PDs in the region) are using
"received" for acknowledgement. It's pronounced REE-ceived. To my knowlege,
NYSP has never used 10 codes.

> It has been my observation that the bigger the department, the less
> likely
> they are to use codes. Unfortunately, the purpose of those code is to
> make the transmission of information shorter and clearer. Most
> departments use them to obscure things, often even from themselves.

NYPD (NY City) uses a VERY long list of codes. In fact, I doubt they say
anything in plain language. Just an exception that proves the rule, I guess.
Of course, NYC public safety is like another planet anyway....

The Rochester, NY police discontinued the use of dispatch 10-codes a
couple of years ago, but the codes they use to clear jobs were expanded to
include an "action" code followed by a "situation found" code. Since those
codes are given [sometimes a long while] after the job is dispatched, they
aren't of much use to the average scanner listener.

> in place of the signals. If you hear some cop say 'that's clear' or

That phrase is also common in the Buffalo, NY area.

Sorry, I didn't realise that the step would stay 12.5KHz, regardless of
the setting that you put in the radio. I just tested it, and even if you
put it on 15KHz, it still steps 12.5. No malintentions to anyone, and
thanks Jon, for pointing that out... GV

It is also fun to program a handipacket TNC (a box the size of
playing cards with a computer serial port and radio xmit-rcv port
with processor) to emit say, an automatic id every 37 seconds, then
attach it to your HT and take it in the car with you.

What this does is to "key down" every 37 seconds with your id.

To analog users it sounds like a bronx cheer "brrrrrrraaaap"
every few seconds.

Of course it would be illegal to program it to id with other than your own
amateur id or to transmit on anything but authorized amateur frequencies.

I replaced my R7000 with an R7100 over a year ago and
posted this comparison. Both models scan slowly and have clunky
relays so they don't make great scanners per se.
They do make great VHF/UHF receivers, though.

COMPARING THE ICOM R7100 TO THE R7000 RECEIVER

by Bob Parnass, AJ9S

The radio RF/IF/AF portions of the R7100 are similar to the
older R7000, but the R7100 is constructed using surface
mount parts. Consequently, the R7100 is smaller. A-B tests
indicate both the R7100 and Radio Shack PRO-2006 receivers
are about equally sensitive, and more sensitive than the 6
year old R7000. Both the R7000 and R7100 are much more
immune to intermod than the Uniden/Bearcat 760XLT and the
portable PRO-43.

Many of the functions controlled by separate rotary switches
and potentiometers in the R7000 are controlled by pushbutton
switches and firmware in the R7100.

Deleted Tuning Meter, Added AFC

Too bad the R7000's analog center reading meter function was
replaced with 3 indicators on the R7100, a left arrow, a
square, and a right arrow. In my R7100, the square lights
if you are tuned within 2.5 kHz of center of an FM station,
a larger window for WBFM signals. The arrow indicates the
direction in which the tuning knob should turned to center
the receiver on the signal.

The R7100 has an interesting AFC circuit, controlled by a
front panel switch. The AFC will automagically tune the

receiver close to the center frequency if you tune near an FM signal. You can watch the frequency change as the AFC steps the receiver in 100 Hz increments (on NBFM). The AFC never quite tunes to the exact center, but tunes within a window set by a difference amplifier circuit, so the station sounds good even though the R7100 is slightly off center frequency.

Modes

R7000 and R7100 users have the same choice of modes, but they are easily selected from front panels controls in the new R7100. A rear mounted slide switch is used for USB/LSB selection in the R7000.

Fancy Firmware for Memory Organization and Scanning

The firmware in the R7100 is much more sophisticated, and a brief article wouldn't do it justice. There are 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. There are many possible ways to scan, more than listed here. You can scan:

all channels
all channels in a given bank
all channels in a given group
all channels in a given group in a given bank

all channels in a given emission mode
all channels in a given emission mode in a given bank

As with most other scanners, there is a lockout bit for each channel, so you don't have to scan the NOAA weather channel even though you have it in memory.

There are 10 pairs of search limits. The search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. I used this for searching for federal stations in the 162-170 MHz range while skipping the NOAA weather channels 162.55, 162.4, and 162.475 MHz, as well as some veteran's hospital paging channels.

The R7100 has 2 VFOs, but Icom calls them windows. There are several window scan modes, but they resemble priority scan modes in a Bearcat scanner.

Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Perhaps a bigger drawback is that both the R7100 and R7000 employs a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies

serenades the Icom user with a very annoying clickety-clack, clickety-clack!

New Memory Query Feature

The R7100, like the Bearcat 200xlt, has a feature which allows you to detect memory channels programmed with duplicate frequencies.

Tuning Step Selections

The R7000 tuning step size is selected using a rotary switch. The R7100 tuning step size is selected by using a pushbutton to step through the selections. The R7100 has more choices, including a 100 kHz step, useful for tuning around the aircraft bands.

Another new R7100 feature is that a tuning step size can be stored into each of the 900 memory channels, so when you use the tuning knob to tune off a memory channel, the R7100 tunes in reasonable increments (e.g., 12.5 kHz in the 450 MHz range, 10 kHz in the VHF-low band, etc.).

Rescan Delay Added, but Nondefeatable

Icom finally included a decent 2 second rescan delay in the R7100 which owners complained was missing from the R7000. Ironically, you cannot defeat the rescan delay in the R7100, so it's now more difficult to scan trunked systems in which the frequency changes with each new repeater transmission! Using the VSC voice squelch helps shorten the rescan delay unless scanning noisy stations.

Power Supply and More

The internal power supply in both radios runs hot. The R7100 comes with a 12 VDC power cord included, an option in the R7000.

The R7000 comes with a handy carrying handle and rubber feet, an $8.50 option on the R7100.

Added Clock and Timers

Unlike the R7000, the R7100 contains a digital clock and timers which can be used to turn the radio on and off, and tune to different channels, several times each day. I probably won't be using timers, though.

Which Radio to Buy

For fast, reliable scanning, you still can't beat a PRO-2006. If you want SSB reception, computer control, or a radio with a tuning knob and lots of features, I recommend the Icom radios.

The R7100 is more complicated to use than the R7000. There are so many firmware controlled features and there are several 2 key sequencies.

Faced with choosing between an R7000 or an R7100 in a similar price range, I prefer the newer R7100. Sensitivity aside, both are about equal communications receivers, but the R7100 is a better scanner, especially for finding new frequencies and organizing memory.

Even though there is this limitation, cell-phone
converstations can still be heard pretty well,
I have been told.

However, the 800mhz sensitivity is nowhere near as
good as scanners or my old ICW2A. Don't buy the 530
if that is really important. As a Ham radio, it is
superb.

Never meant to imply any malintentions, I'm sure you know that. Needless
to say I was quite dissapointed when I purchased my FT530 a year or so
ago, modified it and found out.

Tomorrow I'm going to a HAMfest in Richmond (Frostfest) and keeping an eye
out for a IC-W2A, Now THAT was a radio, and 30Kc was automatic in certain
portions of the 800Mhz range... Heh heh... BTW, It performed quite nicely
(tx) into a dummy load (!) pretty much throughout 410-490 and 110-190
after hardware modifications. Intermod performance was good too. My third
or fourth radio, but my favorite for a broad spectrum of uses.

Does anyone have information on the operational characteristics of the new
FT51R and the not so new anymore IC-W21A ??

The PRO-51 is now on sale for $219.95 as a mgr's special (unadvertised).
(This has been mentioned before w/i the last week here on this newsgrp.)
There are several units out there that have a 7A4 date code with a FCC ID
of AAO20-308 and a serial number of digits with no 'A' ... the daughter
board mod of disconnecting just the brown wire is effective when the
2+9+LOCKOUT keys are depressed; i.e., it works.

Now my question has already been asked before, but I'll ask it again:
Is there a way to transfer either a Monitor channel and/or a dedicated
channel (1-200) into the Priority Lo/Hi Limits for scanning? (Obviously
this is not possible with the unit as is, so I would imagine a hardware
mod would be necessary.)

thanks for any input,

Mark Colosia

Dont think the NEWER Scanners can be modified for cell Phones otheriwse
the manufactures will have to stop making them . this can get costly for
them.Your probably better off getting a GRE converter or a scanner that

I don't know how close to the SF Bay Area you are but, I just bought 1 from
Scanners Unlimited, 1199A Laurel St. San Carlos CA 94070 (415)573-1624

US version. I told him that it wz posted all over the Net that a dealer had them
for $585.00 and he matched the price :-) CASH only though, no checks
or visa for that price. I do think te best price i saw was 589.00 .

Good luck +
ooops....ask for Glen (owner) let him know that the NET lead you to him :-)

Maybe we should try looking for the service manual...Lots of good
information in service manuals. I think the TR-2400 is also the
Camnis HSC-050, so either one would do.
Good luck,
Dave

I was under the impression that the Uniden/Bearcat BC9000XLT will
be available in quantities (in the USA) starting next month.

A BC9000XLT is sitting in my living room, "resting"
after being used heavily for about 2 weeks. I finished testing
and a writeup, so look for a review in a future issue of
Monitoring Times magazine.

Personally, I prefer the BC9000XLT to the 1,000 channel Radio
Shack PRO-2035 for a lot of reasons, although I would grab a PRO-2035
if a saw one at a "hamfest" price. Overall, the 9000XLT is
more "usable" -- with reasonably-sized banks of 20 channels each,
intelligent and fast Auto Store, alphanumeric tagging, etc.
CTCSS is an option for the 9000 but not available for the PRO-2035.
Although the PRO-2035 is no tortoise, it scans at only half
the speed of the BC9000XLT.

The BC9000XLT works best on an outdoor antenna so it won't
hear its own display and CPU circuitry.

I didn't intend to send two copies of that post.
I sent it from the web browser Netscape which I was using to
read the news. I punched the reload button after I got
the message that the article had been succesfully posted.

Reload button apparently means redo last action, not reload
for it posted the article all over again.

You live and learn. Sorry for the wasted bandwith.

BTW NETSCAPE is a fantastic way to surf the Internet
and it is FREE. Get the latest version 1.0N at URL
ftp://ftp.mcom.com/netscape

UGH that above dosn't sound good. Can't the engineers at
Bearcat ever get anything right? Or is it they do and
the sales dept then figures out ways to cheapen the manufacturing
process so they will make more profit per unit sold?

I am willing to bet that there are a bunch more gottchas
with this item.How does it perform when sitting next to a PC
that is running without an outside antenna? with one?

How do OTHER radios perform when sitting near this unit
while running? Especially ham ht's and hf radios? Do they pick
up its unshielded digital noise?

Vic

UGH that above dosn't sound good. Can't the engineers at
Bearcat ever get anything right? Or is it they do and
the sales dept then figures out ways to cheapen the manufacturing
process so they will make more profit per unit sold?

I am willing to bet that there are a bunch more gottchas
with this item.How does it perform when sitting next to a PC
that is running without an outside antenna? with one?

How do OTHER radios perform when sitting near this unit
while running? Especially ham ht's and hf radios? Do they pick
up its unshielded digital noise?

Vic

Huh? -------+

They got the BC9000XLT and BC3000XLT right after having problems
with the BC8500XLT and BC2500XLT. Except for an out-of-tolerance
Zener diode, the older BC200XLT was right, too.

>Or is it they do and
>the sales dept then figures out ways to cheapen the manufacturing

The BC9000XLT noise is confined to discrete frequencies.
Thankfully, it is *not* the evil broadband hash made by the Radio
Shack PRO-2003 display and Regency M-400 keyboard.

The BC9000XLT noise is not bad -- but it is there. I mentioned
it because scanner buyers (like us) are entitled to know
about the warts and wrinkles as well as the merits.
Those who prefer warm, 100% positive "reviews" can read elsewhere.

>I am willing to bet that there are a bunch more gottchas
>with this item.How does it perform when sitting next to a PC
>that is running without an outside antenna? with one?

I don't know. With one exception, I avoid operating the PC and
scanners in the same room concurrently.

>How do OTHER radios perform when sitting near this unit
>while running? Especially ham ht's and hf radios? Do they pick
>up its unshielded digital noise?

During daily operation, the BC9000XLT has been a good neighbor
to my other radios -- at least on the frequencies I tried.

I do turn off my two 49 MHz baby monitor repeaters, BC300s,
and crystal controlled scanners when testing because their
local oscillators radiate signals.

The BC9000XLT is housed in a metal case and plastic front panel,
a combination I prefer to the entirely plastic case and panel
on my PRO-2005/6s.

It *would* be interesting to place all these scanners in an RF
chamber and produce an emission profile across the spectrum.
Manufacturers do this for Part 15 compliance testing
but don't make the detailed results available to consumers.

Hack 4.

Print your search with the printer OFF. Allow the program to exit when
you get the printer error.

You then have the TEMP.DBF file in the root directory.

Hack 5

Use Microsoft Access. Attach the main DBF file from the CD as a table.
Create a query and then export the result. You then have whatever you
set up in the query. I did this to export all Michigan records.

ki4je (vhealey@crl.com) wrote:

@SUBJECT:NEW MD state police bandplan N
Hi everyone - recently I noted a set of msgs from one Alex Cernyakov re MD
state police frequencies; this list that he apparently got from a PG county
officer is VERY out of date. Back in late 1993, the Md state police re-arranged
their freq bandplan; part of this was the release of the old Baltimore County
39 mhz freq system (they have since implemented 3 seperate 800 mhz systems
county-wide). The MSP also got some new programmable radios. This information
comes from various sources:
a. The Radio Monitors Newsletter of Md. (some of this came
from MSP officers)
b. The 'Listening post' net I used to run in this area
c. My own observations. Those freqs I have confirmed will
be marked with a '*'.

Please refer to the posting by Alex; it is too long to repro- duce here...
MSP HQ - although 39.10 remains the main channel, there are
4 other channels available for use. I have not yet noted
much activity on them, but that may change in the future.
These frequencies are:
a2 = 39.26
b4 = 39.24 pl=146.2
b15 = 39.34 pl=127.3
b16 = 39.62
(oh I forgot to mention; unless I state otherwise, the PL
tone used is 110.9).

Here are the specific corrections to that list; Alan Henney
of CHM, please note and distribute;
Barrack Location Frequency Notes
======= ======== ========= =====
A Waterloo 39.42 Jessup closed
D Belair 39.92*
E Salisbury 39.78
F Northeast 39.84*
H Waldorf 39.06
I Easton 39.96*
K Security closed and converted to a state
holding center
L Forestville 39.30
M Perryville 39.24* simulcast on 151.04*
with SHA equip/personn.
pl=127.3
Q College Park 39.34 special crash unit for
I95/495 corridor around
College Park,Silver

Spring areas
R Golden Ring 39.44* Valley closed
S Centreville 39.80*
T Leonardtown 39.38 also used by MSP
aviation division, based
in Middle River
U Prince Frederick 39.28
V Berlin 39.60 PL=179.9

All other 39 mhz freqs are correct, as far as I know. I have
not hrd the Port of Baltimore MSP unit frequency of 154.725 yet;
I will check this.

Hope this clears up some of the confusion that seems to have
reared its ugly head on some of the msgs noted here and on the
Fido network on this subject. Hopefully when the new Scanner
Guide comes out (I hear sometime this year), all this will be
documented more fully. I am interested myself; I am one of
the contributors.

Julian Grammer <julian@kesteven.win-uk.net> wrote about the
Radio Shack PRO-2003:

>Can you give details of this scanner? I've had a 2004 for, I'd
>guess, about six years now, but I wasn't aware of a 2003.

From the FAQ article "Buying a Used Scanner Radio" I post
monthly or so:

PRO2003: Radio Shack's 1986 top of line. 50 channels + 10
FM commercial broadcast band channels. Includes aircraft.
Good frequency coverage and functionality, but at a high
price. Poor human engineering: difficult to read keyboard
makes the PRO2003 hard to operate unless in a well lit
room. Keyboard label coloring improved on newer units.
Rather slow scan rate and high price. Although there are
provisions for 12VDC operation, the cabinet shape and lack
of mounting bracket makes mobile operation impractical.
Scan rate only 8 channels/sec vs. 15/sec in Regency and
Bearcat. Causes RFI: Plastic case permits scanner to
radiate signals into nearby receivers.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?" Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books

The most convenient source of fire and police frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $10. Police Call is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. Later editions have included a few pages of local airport and nonsensitive federal government frequencies.

I highly recommend Richard Barnett's 1992 book, Monitor America, published by Scanner Master Corp., and available from Grove Enterprises for about $25. This second edition is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the world's largest scanning club, the Radio Communications Monitoring Association (RCMA). Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The second edition is about 400 pages and is available from Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $20. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is the best book in print for this difficult to obtain information.

A more accurate, but smaller and less comprehensive book is Midwest Federal Frequency Directory. It was published in 1986, and copies are getting scarce. Copies may still be available for $10 from Scan America.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 | instead. The fields are similar to PerCon's Spectrum CDROM | (see below), but the transmitter and licensee location are | intermixed which makes query results confusing. The first | release has problems with mistakes in the data and | documentation, and I look forward to a new release to | correct these shortcomings.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells | for $29 and contains a handful of fields for every FCC | license in the US. It works well.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

As I have already done for dozens of radio enthusiasts in | several states, I will locate FCC licensed and selected FAA | transmitter sites in an area of your choice, and produce a | custom color map. I call this new innovation RadioMap(TM) | service. It allows you to identify antenna sites | (including paging and cellular phone cell sites) and visualize the transmitter locations in your neighborhood,

near your office, at an airport, and other places of | interest -- from VLF through microwave. |

This is completely different from the limited maps | displayed on the Grove Enterprises CDROM. Through a new | licensing arrangement with a professional mapping company, | RadioMap shows detailed streets, railroads, rivers, and | cities. Ham radio stations are not shown as they would | clutter the RadioMap. RadioMap includes key sheets which list frequencies, callsigns, and licensee names. In rural areas, ranges of up to 10 miles are possible, while ranges of 1/2 to 3 miles produce best results in urban cities.

I will produce custom color 8-1/2" by 11" RadioMap reports, | suitable for framing or laminating, for areas in any of the | 50 states. Send $19.95 for each color RadioMap, your name, address, and telephone number, along with center location | (nearest intersection of 2 streets, or latitude & | longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL | 60543. tel. 708-554-3839 6-10 PM central time.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on

the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the

taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's

"search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described in Part I of this article, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

I tried this scheme and it appears to work but,
my qery for Ga resulted in seventy thousand records.
Everytime I tried to expot them access said that was too much.
I finally just wrote them as a rtf file that was about 80 megabytes.
That is too large to really work with I must be missing something
still. I want to export the data as an access database file.
I want to index it for FAST access.

By the way the query took over an hour? Is that right?
486DX40 with 4 meg disk cache? 2 Meg cdrom cache? 12 meg sys mem.

By the way when you attach it it asks for an index.
I see there are seven or eight index files on the cdrom
for fccusa.dbf Which did you choose?

In article <1995Jan11.204021.11983@news.brandonu.ca> $laskowskimw@news.brandonu.ca writes:

>I am wondering if someone can explain to me what trunking means?
>Any information would be greatly appreciated

A simple example of trunking:
Instead of having every radio set to a particular frequency, the channel selector actually selects an ID. The radios are in constant communication with some type of control channel. The control channel has the ability to make the radio change frequencies.

When someone keys up, the control repeater looks for an open frequency and assignes all radios with that ID to an open channel. The main advantage to a system like this is that you could have 30 different groups (or channels) with only 5 actual frequencies. As long as traffic isn't so heavy that all 5 frequencies are always busy (actually 4 frequencies, since the control channel takes one).

Hope that make sense.

>4.9152 (NMP 049)

>-4.9152 MHz (M-IPI-049).

These crystals are probably for chips (ICs) rather than for scanners. Since
scanners don't actually use the fundamental frequency of the crystal, you
could try plugging them into your scanner to see if you receive anything.

Hope that helps.

656. Proposed PRO-43 modification mini-FAQ

Newsgroup: rec.radio.scanner
Date: 1995-01-16 15:56:41 UTC
From: gdallal@world.std.com
Message-ID: <D2I9MH.GFH@world.std.com>
Source record: 262774

** ** Because there is a continuing demand for it, this mini-FAQ
about frequency modifications for the PRO-43 will be posted
weekly until someone tells me to "get rid of it". ** **

Which PRO-43 units can be modified?

Modifiable | Nonmodifiable
|
serial number no A in # | begins with A
FCC-ID AA020-300 | AA020-300A

There are no software modifications for the PRO-43. It is
not possible to extend the frequency range of the radio by
pushing buttons from the keypad. Such modifications are
possible with other units, such as the PRO-51, but *not* with
the PRO-43. The PRO-43, made by GRE (General Radio
Electronics) of Japan, is one of Radio Shack's few triple
conversion units. Radio Shack units with software
modifictations are double conversion units made by Uniden.

Modification procedures for other radios are available by
anonymous ftp from the pub/hamradio/mods/<manufacturer>
subdirectories at oak.oakland.edu.

The modifications follow. There is some debate about whether
step (5) is worthwhile. Many report poor reception; others
report that the unit is not designed for good low band
reception. So, if you trash the diode in step 4 or want to
quit while your ahead, don't lose sleep over it.

From: armille@afterlife.ncsc.mil (A. Ray Miller)
Newsgroups: alt.radio.scanner
Subject: TWO frequency mods for the PRO-43
Summary: cellular (870-890 MHz) and low band (51-88 MHz) restoration for PRO-43
Message-ID: <1992Aug20.045656.5971@afterlife.ncsc.mil>
Date: 20 Aug 92 04:56:56 GMT

A few people have mentioned the cellular mod for the PRO-43; it turns out
you should not remove but MOVE the diode. Doing so allows cellular coverage as
well as low band (up to 88 MHz) coverage.

Acknowledgments to Grove Enterprises; this information came from them.
They are selling the PRO-43 for $300 which is $50 less than Radio Shack.
I have no connection with them other than as a satisfied customer.

PRO-43
Cellular Frequency Restoration and Low Band Expansion

Note: It is not lawful to monitor cellular or conventional mobile telephone conversations.

The following procedure requires familiarity with microcircuit soldering and will violate your warranty. Grove Enterprises assumes no liability resulting from its attempt, nor will accept the modified scanner for return under any condition.

TOOLS NEEDED: Fine point, low power soldering pencil; solder wick or a desoldering tool; pointed awl, hemostats or pointed tweezers; small Philips screwdriver; solder.

1) Remove the battery, antenna and back cover (held in place by four screws).

2) Remove the six screws holding the top circuit board in place. Carefully unsolder the two antenna connections from the board. Bend the antenna ground tab fully up from the board. Carefully lift the board, unplugging the black connector at its base, and lay the board out of the way on its bundle of colored wires.

3) Remove the two screws from the next board and lift it, carefully unplugging the white connector at the bottom of the board. Lift it up and lay it aside on its brown wire (which can be unplugged if necessary).

4) Unsolder and remove the metal shield from the final board, revealing the microprocessor; note the row of diodes labeled D1-D5 above it. Only diodes D1, D2, and D4 are present; assisted by a pointed tool, unsolder and remove D4, the lone diode (this restores cellular frequencies which will be searched in 30 kHz steps).

5) Resolder the removed diode carefully into position D3 to extend low band coverage to 88 MHz.

6) Reassemble the boards, paying particular attention to the alignment of the plugs. Test the radio by entering any frequency between 870 and 890 MHz (cellular) and 51-88 MHz (low band).

658. Yupi freq calibration (was AR8000 Rx signal breakup)

Newsgroup: rec.radio.scanner
Date: 1995-01-16 16:40:09 UTC
From: horak@convex.com
Message-ID: <3fe7h9$e4c@eugene.convex.com>
Source record: 262877

In <3fc0ub$l6l@panix3.panix.com> schuster@panix.com (Michael Schuster) writes:

>I think your stuck with it; though the problem will obviously be worse if
>your scanner's frequency calibration is way off - causing more of the FM
>signal to get chopped by the IF filter.

Speaking of freq calibration being way off, my Yupi MVT7100 readout was 5KHz lower than the actual freq on VHF/UHF low. I had to program freqs 5KHz low if I wanted them to sound good. Actually, they were about 4KHz low. Anyway, with Yupi technical help being nonexistent, I took the unit apart (easy) and pulled the front off. There are several boards in there but it was obvious that the calibration was on the bottom board. There are only two adjustments that can be seen when the unit is opened up. Anyway, I made special note of where these adjustments were tweaked since I didn't know for sure what they would do. The lower adjustment was the right one (upper one is a coil, bottom one is someo sort of TXC) and I managed to get my VHF/UHF low in line. I noticed that the 800 MHz band gets off frequency in the OPPOSITE direction when this is tweaked so I had to find a happy medium in the adjustment that left my lower bands about 1KHz above the readout and the 800 MHz band about 3 KHz below the actual readout. Anyway, I consider my effort a success, not having any schematic or a clue as to what was what! I should have made a note of the actual ref designations in case any of you have a similar problem but I didn't. Anyway, once you get inside, it's fairly obvious. One other note, as soon as the front/back separates when you take it apart, you loose all memories!

with your comments.
A working copy of Radio Manger and File Manager is in my ~/www
directory and can be reached from ar8000.homepage
Possibly someone may want to forward to him technical info
to assist him in considering the ar8000 asap. Thanks to
the folks who wrote to tell me how to contact someone on
Compuserve.

Note I added a web page that searchs the internet for
text etc. Let me know how it works for you and your web
browser from the ar8000 page. I stole the idea from a site
while surfing the net and I think it is a neat powerful trick
that you may benefit from!

<Grin>

Hi Vic,

Thanks for uploading Radio Manager for me. Radio Manager only controls the
Icoms and OptoScan456 radios now, not the AR8000. I know that radio has an
interface and lots of other great features, but I don't know any more than that
about it. If it uses the Icom CI-V protocol, programming would be pretty easy.
Otherwise, it would be quite difficult, especially since I don't have an AR8000.
I would like to have one, but I don't have the money for one now. I don't have
WWW access yet, but should fairly soon, and I am anxious to check out any radio
related information. Thanks for telling me where to look.

As a matter of fact, I'm going to be releasing FM 1.06 today. It adds 3 new
fields: Squelch Tone, Repeater Offset (-/+), and an Auxiliary File. I use
Borland Pascal and the Paradox Database Engine, so switching to Access, is not
as easy as it would be in VB. I'm curious. How would you use FM differently if
I added OLE support? I like incorporating new technology into my programs, but
I haven't thought too much yet about how OLE would improve FM or RM. I'm always
open for suggestions. That's why I've made most upgrades to my programs. Thank
you for taking the time to let me know what you think.
Sincerely & 73,
Ben

I also have the bounce problem with the dial selector on my AOR8000 but my
bandplan is a fairly good US plan (some errors though).

Are they selling units in the US that have been cellular castrated but have
the UK pandplan? I thought those two operations would be done together.

In the aviation newsgroups I usually read, there are often interesting
and funny conversations heard on the air between Air Traffic and pilots.
Thought I would try something similar here. Thanks to all who have
helped me find freqs in the Seattle area to try my new scanner on.

Robert 4: Robert 2, are you in the parking garage ?
Robert 2: Afirm.
Robert 4: Where are you ? I don't see you.
Robert 2: In the police car with the flashing lights on top!

Dispatch: Animal control is coming for the stray dog, what kind is it?
Adam 7 : What?
Dispatch: They want to know what kind of dog it is.
Adam 7 : I don't know dogs. It's a small fuzzy one.

Union 6 : Request a 932 (Seattle code for coffee break)
Dispatch: Go ahead.
Union 2 : Union 2 will back.
Dispatch: OK.

My best wishes for the friends and families of our four lost firefighters.

>Bob Parnass, AJ9S - AT&T Bell Labs - parnass@ihlpf.att.com - (708)979-5414

Well Bob I took apart the AR8000 interface this afternoon for a quick look.

What I found was that inside a tightly built little cast aluminum case
there was a single double sided circuit board with plated thru holes.
There were 12 caps 1 transistor three ics 1 Led and five other diodes and I
guess a half dozen resistors.

Not much.

Now the computer feeds a mini rs232 plug on the back side of the board.
Associated with this area is a Maxim MA232 CPE IC 9405B
There are six caps tied to this chip, five of them identical 22uF at 16 volts.

The program slot from the AR8000 is tied to Toshiba 8920H
74 HC 157 AP

The clone slot from a AR8000 is tied to a Toshiba 9346H
74 HC 123 AP

At first I though the board was missing a bunch of prospective
componets but I realized that all those nice holes where well
plated thru and provided a connection to both sides electrically.
That made tracing out the circuit alot harder then I am willing
to do in my limited time. Sorry.

I can see that the program slot is the one that provides the power.
There doesn't look like any power is taken from the clone side.

The board should be dead if the ar8000 is plugged in here only.

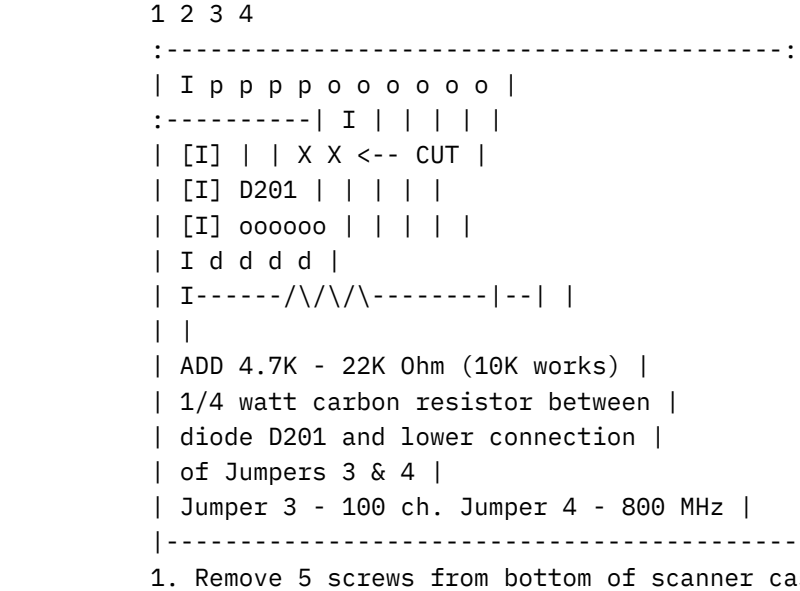
Help me find a way to implement the keypad modification! Read my previous post "BC855XLT Keypad Mod Found!" for more info. -Eric

Usual disclaimer- I did not write this modification and I take no responsibility for its accuracy or legality...

UNIDEN BC-855XLT MODIFICATIONS (OLD BOARD ONLY)

NOTE: use ONLY on boards marked PH-120AE.... use on any other board will COOK your Scanner

Scope of modifications:
[1] Allow continuous 800 MHz receive.
[2] Increase channel capacity from 50 to 100 ch.



1 2 3 4
I p p p p o o o o o o
I
[I]
X X <-- CUT
[I] D201
[I] oooooo
I d d d d
ADD 4.7K - 22K Ohm (10K works)
1/4 watt carbon resistor between
diode D201 and lower connection
of Jumpers 3 & 4
Jumper 3 - 100 ch. Jumper 4 - 800 MHz

1. Remove 5 screws from bottom of scanner case.
2. Carefully separate case top and bottom.
3. Unplug connector to the internal speaker.
4. Locate diode D201 and 4 jumpers near edge of circuit board.
5. Cut the 3rd and 4th jumpers near the middle and fold downwulate leads, if necessary.
6. Connect the lower part of jumper 3 & 4 to one end of a 10K Ohm 1/4 watt carbon resistor, insulate all exposed leads.
7. Connect the other resistor lead to the lower connection of diode D201, DO NOT cut any leads on D201.
8. Make sure all exposed leads aren't touching any other connections, insulate as required, tack in place with a dab of RTV silicone, or low temp hot glue.
9. Reassemble scanner, make sure to plug the speaker back in. You should now have a scanner with 100 chs. numbered 01-00 s

in 5 banks of 20 ch. and continuous 800 MHz coverage.

** This information for educational and lawful use ONLY **

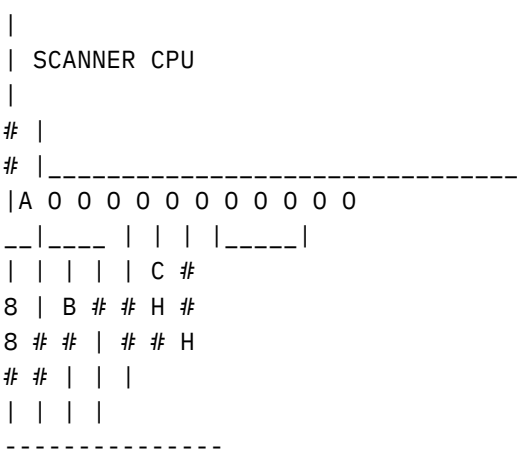
USE ONLY AT YOUR OWN RISK! Neither the author nor the poster of this instruction file claims any responsibility towards damage to equipment.

NOTE: This mod is for _older_ models of this scanner!!! The reported new boa
rd _will be destroyed_ if this modification is used.....

BC 855 XLT Modifications (NEW BOARD ONLY)

First of all, This mod is for newer BC-855XLTS with circuit board labeled "PH-120AF" ONLY.
1. remove antenna and power from unit.
2. remove cabinet from unit.
3. locate circuit board attached to the top panel and remove the screws holding it down.
4. locate the chip jumper shown by "H" below; apply heat with soldering iron and remove it carefully, using a desoldering tool or wick. Save the chip incase you wish to restore for warranty repair later.
5. Cut enough lead to route the 10K resister between point A and C or alternately Band C. Scrape the green insulation off circuit at C or solder directly to chip at B. Solder the other end of the resistor to the upper pad where you removed the chip jumper in step 4. Be sure to slip a bit of insullation on the leads of the 10K resistor to ensure it does not short against anything
6. Reassemble by reversing steps 1, 2 and, 3. Test by entering a frequency
between 869 and 894 MHz (870.000MHz).

NOTICE : IT IS ILLEGAL TO MONITOR
CELLULAR CONVERSATIONS IN THIS RANGE



I hope this crude drawing doesn't confuse you.

LEGEND:
O = cpu leads
8 = coil or inductor
A, B, C Points to solder 10K resistor

```
H = chip jumper to remove.
# = chip resistor or diode
| = vertical circuit trace
_ = horizontal circuit trace
--------------------------------------------------------------------------
```

Matt, put all the trunked channels for a system in one bank and turn off
any channel delay. If you keep them in one bank and really need to follow
a conversation you can quickly turn off all other banks and just listen
to your trunked system. The reason the delay is set to off is because
when the radio is un-keyed it may very well come up on another freq next
time they key it up again, so you don't want to waste any time listening
to nothing. You also need to be quick with your fingers on the scan
button. You may have to scan past other conversations to get back to the
one you want. It's a hassle but isn't too bad if you don't have too many
systems to follow or too large of a system...Good Luck!

I might add in a situation where you are concentrating on
a particular breaking event, bypass any channel that
has telephone conversation on it. These tend to linger and the same
set of channels usually will get the phone connection in
later calls. Also with the aor 1000 the tunning knob at top
will help you move on. The 1000 isn't an ideal unit for celluar
scanning beecause it checks even empty channels instead of
skipping them. That takes time.

Vic

I found that it helps a little to scan the frequencies in descending
order when monitoring the 5 channel Motorola trunked system
used by Naperville (IL), the city in which I work.

I leave the delay and data skip (aka sound squelch) off, of course.

This won't work with the newer Bearcat BC9000XLT and BC3000XLT
scanners which scan frequencies in ascending order within each bank
no matter the order in which they are programmed.

690. scanner to vox recorder

Newsgroup: rec.radio.scanner
Date: 1995-01-17 01:38:18 UTC
From: jcosiman@clark.net
Message-ID: <3ff72a$9ih@clarknet.clark.net>
Source record: 262907

I've tried two cables to attach my r/s Pro-51 to my r/s CTR-75 vox tape recorder. The first one I got was r/s cat# 42-2152A - Shielded Attenuating Audio Cable. I didn't think I needed an attenuating cable (I'm going from my headphone out on my scanner to mic in on the vox deck), but the rat shack sales guy told me I needed an attenuating cable. It didn't work. Symptoms: tons of 'noise' in the recording. The best way I can describe it is that there would be a hissing sound starting out very quietly, then getting louder and louder. Usually, it was broken my a transmission, but I got the feeling that I would just continue along...

So I figure, OK, I need a non-attenuating cable. I went and got r/s cat# 42-2420, and the same result.

The sales guy there (someone I semi-trust and whose opinion I semi-respect) says that this should be able to work with the equipment I've got. I'm beginning to think that I just need more sophisticated stuff. OK, when I get my Icom IC-R7100, mebbe this won't be an issue anymore, d:-|

So should this be able to work? Can anyone give me some pointers?

I have the RS discone - right now I am using 50 feet of RG-8 to connect it, with a so239 to bnc adapter on the end. The discone is on a 10 foot metal mast attached to the house. The total height is about 35 feet. Is there anything else I need to do about grounding? Any worry about lightening? I don't want to fry my BC-2500XLT. Oh, I live in a rural area.

Thanks

694. is AR8000 inferface standard?

Newsgroup: rec.radio.scanner
Date: 1995-01-17 02:24:34 UTC
From: achern@jupiter.avl.umd.edu
Message-ID: <3ff9p2$lo8@mojo.eng.umd.edu>
Source record: 262910

If I were to order an AR8000 from over-seas (say from Javiation in the U.K.) could I order the computer-interface for it from a local company? In other words, are the interfaces for the AR8000's the same regardless of where the scanner was purchased? I realize this is a rather silly question since an AR8000 is an AR8000 regardless of where it was purchased but I want to make sure I'm not missing anything. Thanks.

-Alex.

695. AR8000 "Feature or Flaw?"

Newsgroup: rec.radio.scanner

Source record: 262911

I hope someone can help me with this one.
I am confused about the search feature on my AR8000.
I have 4 search Banks set up [a b c d]. With Search Bank linking OFF and searching, pressing the 'a' key starts searching bank 'a', 'b' searches 'b' and so on. When I turn Search Bank linking ON and set to link [a b c d] and then go to search mode and press 'a' it goes to bank 'b', pressing 'b' goes to bank 'c' pressing 'c' goes to bank 'd' and pressing 'd' go to 'd'.

Something similar happens when I use banks [A B C D], except 'A' goes to 'A', 'B' goes to 'D', 'C' goes to 'D' and D goes to A

Is this the way the unit should work, is it known problem, or do I have a bad unit?

Thanks
Robert Alpert

Without really seeing how you have it set up I would
say something is wrong. Mine operates the way you expect
in search it goes to whatever key you pree. Linked banks
when there limit is reached it jumps to next bank in link
order. You can change the direction by pushing arrows
or turning the knob.

More then defective I would say you have some other
parameter set incorecttly in Expert mode.

If you have a computer interface you could dump the search
bank settigs and programing for all to examine and
comment on.

Yup.. the only thing you can't do is pass on the information you
hear. The airwaves are public... to LISTEN to, but spreading
information that should not have been heard, is against the law.. as
far as I understand it anyway. :-)

IV>I would buy any of the 100 or more channel radio shack units
IV>and try it for three weeks or so then return it for another
IV>until I found one that meant my needs for now. Start with the cheaper
IV>ones and work up. Radio shack has a thrity day return policy which
IV>is very fair. If you like it so much you miss the 30 day return then
no. not simple. i think that sucks. cuxzbeginner.
no it
IV>Simple?

IV>ki4je

no, it's not simple.

it's all the nasty junk we have to take back from people using & abusing
the scanners for 3 weeks and then re-selling it back to the general
public again, only to hear them complain about the scanner being dirty
or the box missing instructions or something else...

basically, Radio Shack's policy on returning used junk is bunch of BS
cuz the customers should take more care of the products to get their
moeny back, or lose it in the long run.

PS> Retail sucks. period.

From: mnappo@mhv.net
Message-ID: <3ffg91$rhb@over.mhv.net>
Source record: 262923

I'm about to retire my ol' BC 20/20 in favor of the BC890xlt. I live close to a National Weather Service transmitter and would get occasional bleed from it in the 155 mhz band on the 20/20 and hand-helds. Any comments about the selectivity and/or sensitivity of the BC890xlt? Maybe a suggestion as to what to look for on a scanner spec sheet to keep down the bleed? I use a full spectrum outdoor antenna (which of course doesn't help matters) but living in the country I don't have much of a choice.
Email answers are welcome.
Thanks to all!

I saw a recent version on Compuserve. What is it? Maybe I'll download it.

ACE has a very bad reputation for less than honest business practices. I
would only use them as a last resort. Their right to sell AOR scanners was
taken away. That's why they sell AOR scanners under the Trident name.

>TIA for any help

>Jack D

The best BBS would be the BASE club BBS. The Bay Area Scanner Enthusiests club has a BBS they maintain, but you have to join the club to get access. For frequency info, you'll want to visit Scanners Unlimited on Laurel St. in San Carlos. They have lots of directories. There is another BBS that has an online database, but I can't remember the details. I'll see if I can find the info.

When using a scanner with 5kHz channel spacing on FM and you
want to get something spaced at 12.5kHz, is it generally better
to tune 2.5kHz above or below the actual frequency, particularly
if it is AM?
The Pro39 automatically rounds it down.
Is it at all analogous to tuning a television, when the picture is
much softer when tuned off in one direction??

The 2006 is a much better scanner.

You should be able to get a 760 (new) for about $200. The 2006 is no longer made, so I don't know what they would sell for

Sounds like he bought a few of the remaining modifiables in hopes of selling them at a premium. You might want to wait a bit longer to try this scheme.

The Louisville, KY PD just uses "okay" for acknowledgement. For example,
after the dispatcher sends car 532 on a run, you'll hear "532's okay."

Message-ID: <Harrington.Ed-1701951125190001@157.176.66.38>
Source record: 262794

I have a nearly brand new handheld Realistic PRO-50 Scanner with a GRE Superconverter. The PRO-50 covers the standard VHF/UHF bands including the 6m, 2m, and 70cm ham bands along with the Police, Fire, Medic and Public Safety bands. The GRE Superconverter is a small antenna connector mountable module that fits on the handheld unit. It downconverts the 800-900 Mhz band to 400-500 Mhz bands yielding full mobile/base station cellular coverage with no gaps.

I will ship the package in the original boxes with manuals for $150. If you are interested, plaease E-mail or call me at 508-880-4292.

Thanks and 73s,
Ed--AA1IN.

Nicholas,
Sorry It took a while to get back to you. I infrequently check Newsgroups, and keep plenty busy just answering direct EMAIL to my AOL, LAN and DDN boxes.

Tactical Air Command (TAC) and Strategic Air Command (SAC) were combined into one command, Air Combat Command (ACC) here at Langley AFB. ACC hase much the same "flavor" as TAC had, but with expanded horizons by the addition of the Tactical bomber wings, and some misstles and tankers. (We're developing a "Composite Wing" concept, that basically includes all the aircraft required to support that particular wing's mission.) ACC also picked up our Tactical C-130 wings again (TAC used to have 'em in the 70's) from Air Mobility Command (AMC). AMC has totally replaced Military Airlift Command (MAC), and remains at Scott AFB IL. AF Logistics Command (AFLC) combined with [can't think of the acronym at the moment] to become AF Material Command (AFMC) at Wright- Patterson AFB OH. I'm not sure of what elements combined with ESC to form AF Intelligence Command, but they're still at Goodfellow AFB TX. US Strategic Command is not a derivitive of SAC, but did pick up a lot of SACs nuclear assets; they combined with the Navy's nuclear assets (particularly subs) and are under command of a U.S. Navy Admiral at Offutt AFB NE.
Hope this helps! ...Toby Huff

When I am in the memory recall mode 'M.RE' the tuning knob will step me through the memories I have programmed, in order, either up or down, and works fine mostly. But, once in a while, instead of going to the next memory the radio will stay on the same memory channel or jump two or three channels when the knob is turned. Somtimes just a slight touch of the knob will do it.

A similar thing happens in the VFO tuneing mode.

By the way, all you hams out there. Let's make it a rule that we put our callsigns in the alpha display at memory location a49 (the last memory, or the last memory channel of any scanner that has alpha display) to help in the recovery of stolen scanners.

Heres the infamous 800 mod:

This modification is courtesy of Monitoring Times magazine and the Grove Enterprises BBS - Brasstown, NC. 704-837-9200/704-837-5957/704-837-7081 (High Speed Modem).

Realisticr PRO-39 Cellular Restoration Instructions By Larry Wiland

NOTE: It is unlawful to monitor mobile telephone conversations, including cellular. Although the procedure described below will restore the missing cellular frequencies to your radio, it is possible to hear this range without any modification whatsoever by tuning in the image frequencies 21.6 MHz higher than the deleted ranges. Cellular calls will be heard from 894.01- 915.6 MHz on your scanner without restoration.

Grove Enterprises assumes no responsibility for damages or other liability resulting from attempting to duplicate this procedure. It is possible that this modification may void your warranty.

TOOLS NEEDED: Fine-tipped soldering iron, desoldering wick, small Philips screwdriver, long-nosed pliers, rosin core solder.

(1) Remove the battery door, holder and batteries from the bottom of the radio.

(2) Remove the 4 screws from the back of the scanner and carefully lift the back off.

(3) Unplug the two wiring harnesses at their connectors and remove the six bright colored screws holding the circuit board in place. Unsolder the ground wire from the lower right corner of the circuit board. Unsolder the two wire connections from the BNC antenna connector at the board. Carefully lift the board (grasping it near the Molex connector) and set it aside.

(4) Remove the two bright colored screws from the next circuit board. Carefully uplug the two-wire connector. Unsolder and lift the rectangular metal shield exposing the diodes.

(5) Carefully unsolder and remove diode D6 only; this will restore
the missing cellular frequencies which can be searched in appropriate 30
kHz steps.

This completes the cellular restoration. Reverse all procedures to
reassemble the radio and test it by entering any frequency between
869-894 MHz. Curious about the other diodes? D4 would enable 68-88 MHz
coverage, but deletes 30-54 MHz; D5 (present) allows 800 MHz band
operation; and D7 would make cellular spacing 12.5 kHz (incorrect).

. QMPro 1.50 40-5762 . I'm crazy-I keep hearing liberals raising my taxing

Larry.... This is not a new law from Ohio. It was a recent decision (7-0 too) by the Ohio Supreme Court that stated that monitoring cordless telephone conversations were illegal under the Ohio State Constitution's wiretapping section. Previously, cordless phone monitoring was free game in Ohio, and lesser state courts upheld that notion. There is even an exception to the state wiretapping law that permits Ohio law enforcement oficers and any others authorized by law enforcement officers to record telephone conversations without the second partys knowledge. It appears that is now history, but it leaves several questions that need to be answered by additional parallel court cases. There is no new STATE law regarding cordless telephones. .....Daryll

Nicads : 3 to 4 hrs

Alkalines: 10 to 12 hrs

I am also currently trying the HIGH CAPICITY Nicads from Radio Shack rated at 850 milliamperes and I am getting at least 5 maybe 6 as I speak now and still scanning now.Sorry I lost track of time. I been trying them since last night and can say for sure 5 hrs.At 850.. I figure maybe I can get at least 7 hrs??? The batteries are 6 dollars for two . I also heard there may be 1000 milliamperes nicads available but havent found any.MY Nicad battery for my ICOM W2A is a 1000 milliampere.If I were to take the battery apart , then I would find AA size nicads right? I usually get about 7 to 8 hrs of monitoring time there.With 1200 mah batter ,I have gotten over 12 hrs of monitoring time.

The larger capacity the Nicad ... the more operating time you will get. i will keep you posted how much time I acatully get from the High Capacity nicads.

749. Parts for a PRO-34

I do not have an AR-8000 (yet!), but have found a nice antenna that has outperformed ANY that comes stock with any of the ahndheld scanners I have purchased. It is an ICOM dual band (2meter/70cm) FA-1443B. I normally keep it on my ALinco DJ580 dual band amateur set, but when I use it any of my scanners, it always provides better results and over a wide rnge of freqs, including 800 mHz. I'd apprecaite anyone else's comments who have tried this one.

754. Secret Service Frequencies

Newsgroup: rec.radio.scanner
Date: 1995-01-18 04:43:17 UTC
From: robert@eden.com
Message-ID: <3fi695$l4g@boris.eden.com>
Source record: 262676

Former President George and Barbara Bush were in town to celebrate their son's inaguration for Governor of Texas today. Secret Service was active on Baker (165.7875 - simplex) for all announcements of arrivals and departures of motorcade activities. The agents were carrying some handheld radios. I believed these to be on Baker. They are very thin but seemed to have something plugged into the top with a curly cord on it and going to another part of the radio. The Radios look like the motorola sabre radios. But my question is that with all the activity.. there were agents running all over talking into their wrist microphones. These transmissons were NOT on Baker on any of the other common frequencies. In fact I tried some of the ones that used to be active such as Oscar 164.8875, Tango 164.650, etc... I searched and searched all the 162-174, and from about 148-151.625, and briefly from 406-420 mhz, and
heard no other frequencies being used. I assure you they were using others and I assure you that they were United States Secret Service Agents. After talking with a friend tonight about what I didn't find he suggested that they might now be using some frequency hopping radios. They are mentioned in the Kneitel 8th edition book to be around 406-410 mhz.

Can anyone possibly confirm this? Does anyone have any ideas. I know that these are Secret Service agents and I also did not find the scanners stopping on any frequency for D.V.P. noises or anything.

Duncan (dpfg@ukc.ac.uk) wrote:
: I recently purchased a Pro39 from Tandy, and was surprised how
: small it was. I did not believe that the tiny stump of an aerial
: could do anything, so I got the 9-section telescopic aerial to
: slip on the top, and later the "Scanners 3" book. The book said
: that we often use 12.5kHz channel spacing in Britain with a fair
: amount of AM outside airband, and I was wondering if this was
: causing me problems using FM only with 5kHz spacing.

: My observations so far are as follows:

: 1) The 68-88 band is barren, I have heard a couple of weak voices
: but other than that it just stops a few times and hisses, with
: no voice audible. On 68 and 71 roughly there were images of FM
: broadcast stations.

>make sure that your mode is set correctly

: 2) 109-137 received plenty of aircraft. Surprisingly I received
: police on 133 MHz, and on 133.7 police and planes sometimes
: transmitted simultaneously and interfered.

>I doubt the police were on 133.7...this sounds like you were the victim
of IF imaging...the pro-39 is only double conversion, and is rather
prone to this.

: 3) 137-174 had loads of PMR, and police around 155 as expected.
: But the 133 police were stronger.

: 4) 380-512 was pretty bare, apart from very strong police on 474,
: and some weaker police on 450ish. I thought that police should
: be around 450, not 474. I also got some sound from ITV stations.

>again these may be images

: 5) 800-900 was bare apart from a few television sounds. 900
: upwards gave abundant mobile phones, and indeed seem to be its
: speciality. The 934 MHz CB band seems not to be used though.

: 6) The instructions suggested that it retains memories for 1 hour
: without power, but I have left it overnight and longer several times
: after using it with an AC adaptor with no batteries, and nothing
: was erased.

: Any comments or explanations for these phenomena? The Scanners
: book lists fire and ambulance frequencies, but I cannot get the
: exact number due to channel spacing, and they might be AM anyway.

: If anyone has a UK Scanning Directory and would be willing to
: look up a few organisations, could they please E-mail me?

758. Pro-46 DateCode "5A4" Modifiable???

Newsgroup: rec.radio.scanner

From: abe@crl.com
Message-ID: <3fikb9$aag@crl8.crl.com>
Source record: 262681

Hi,

I just bought one of the "un-advertised" special price of $189 for a pro-46. Is this one of the easily modifiable portables? Or (as I fear) is this one of the models that got pulled by Tandy and is much more dificult to modify?

If not:

Would it be possible (in theory) to modify for

A) Cellular
B) 800 Mhz gaps?
C) Millitary

And if so, for theory purposes only, how?

Thanks,

- Abe

The way I understand it, it is against Federal law to monitor cordless
phones. I think the law was botched, however, in that the law states "it
is illegal to monitor the cordless phone transmission from the base unit
to the handset." It says nothing, however, of monitoring the transmission
from the base unit to your own antenna, though. :)

Yes, as I have previously noted in this group, I use one RS cheap
discone inside, while using the more expensive (and larger) one
outside. There is a BIG difference, at least at my location. Try to
get it as high as possible. You will see improvement in all bands,
AND cordless. Good Luck.

>order when monitoring the 5 channel Motorola trunked system
>used by Naperville (IL), the city in which I work.

>I leave the delay and data skip (aka sound squelch) off, of course.

Seconded. If you're blessed with a small Batwing system - ie 5 pairs -
you can even take it a step further by only programming in the 4 voice
channels. First one in is the one "below" the handshake channel.

ie: if data is on 859.2375, then:

1 - 858.2375
2 - 857.2375
3 - 856.2375
4 - 860.2375

I discovered, as Bob has, that the default pattern in which a Batwing
system assigns channels seems to be from the data channel down.

There's also usually on pair that never gets the data channel (the 856
channel in Fayetteville, Ark's case). This also seems to be the one where
phonepatches show up ...

The revised law prohibits monitoring transmissions BETWEEN the base unit
AND the handset, not FROM...TO.

Use of the construction "between .. and" means a transmission in either
direction.

Here is an excerpt of the relevant section of the law:

Public Law 103-414 signed Oct 25, 1994 (was H.R. 4922)

SEC. 202. CORDLESS TELEPHONES.
(a) Definitions. - Section 2510 of title 18, United States
Code, is amended -
(1) in paragraph (1), by striking `, but such term does not
include` and all that follows through `base unit`; and
(2) in paragraph (12), by striking subparagraph (A) and
redesignating subparagraphs (B), (C), and (D) as subparagraphs
(A), (B), and (C), respectively.
(b) Penalty. - Section 2511 of title 18, United States Code, is
amended -
(1) in subsection (4)(b)(i) by inserting `a cordless
telephone communication that is transmitted between the
cordless telephone handset and the base unit,` after `cellular
telephone communication,`; and
(2) in subsection (4)(b)(ii) by inserting `a cordless
telephone communication that is transmitted between the
cordless telephone handset and the base unit,` after `cellular
telephone communication,`.

> starts with 'b' (or wherever it last was searching) but then it should go
> through 'c' 'd' and whatever other banks you selected and then back to 'a'
> unless you are searching in reverse order.

I have been thinking about the orginal query. As stated in the gentlemans above reply don't forget that this radio can go in two directions. That may supprise you when you expect it to go A B C D and its B A D C ... etc

Also I have noticed that due to human error a bank was not programed the way I thought it was. Sometimes it is the right letter but the wrong case. The orginal location may be empty of search dat and the radio is smart enought to skip that. That is why one bank may never show up in expected search pattern.

The other problem is the "Damn Password'. I have found the resulting operation, permision to do this, do that, so agravating with the password I got rid of it. The radio is too complex in trying to push the right buttons to have it sneer at you because you didn't enter a password after turing it on. Several times I expected I had found a bug and it was that password check and denial that was messing things up for me.

Yes its possible to monitor them. Try around 450MHz. I heard the ECPA
banned monitoring them but.....WHO CARES??

From: rsharp@paul.spu.edu
Message-ID: <3fkr8o$i6v@adam.spu.edu>
Source record: 262699

Received a RS Pro-2035 for Christmas, still in the box, only has about four hours on it.

Tried returning it to RS, but with no receipt, only store credit. Anybody want to save tax, and let me throw in some "stuff" to make picking my 4 hour unit up worth it?!

Obviously I can get it's value in store credit, but if you buy it from me for a close to price, I'll throw in software or other stuff for the hassle... and you'll save tax...

Other ideas?

778. Re: Florida Scanner Laws ???

Newsgroup: rec.radio.scanner
Date: 1995-01-19 07:45:26 UTC
From: bsherman@sefl.satelnet.org
Message-ID: <3fl5am$g3a@sefl.satelnet.org>
Source record: 262700

Note in the published regulation it says any freq assigned to police or law enforcement officers.. This does not cover fire depts, and does not seem to apply to any of the newer trunking systems, since they are not designated as police or law enforcement, but rather as public safety since they cover all government aspects including garbage collection, street cleaners, parks dept etc.. Does this mean that if your scanner is tuned to trunking systems, the scanner can be installed in your car??

Does anyone know the mod procedure for the Sony Air to receive 30MHz - 76Mhz.
Currently the scanner has the following frequencies available.
Air 108-136Mhz
FM 76-108Mhz
PB 136-174MHz
AM 100-2100KHz

I'm considering selling the set if I can't access other ranges.
Email me at above address.

781. What are the new Big Bend NP freqs?

Newsgroup: rec.radio.scanner
Date: 1995-01-19 19:38:32 UTC
From: horak@convex.com
Message-ID: <3fmf3o$76d@eugene.convex.com>
Source record: 262593

Just curious if anyone has figured out the new Big Bend National Park freqs yet. They've been in operation for about two years. I'm planning a trip there soon and would appreciate any info. They don't use 166.375 any more (although it may be used as a backup) and I would imagine the new freqs are somewhere between 406 and 420 MHz.

Thanks,

David Horak horak@convex.com

Monitoring Times had an article on them in August 1994.

Slick radio! If you steal one watch out for the feature where they
can remotely turn it on without your knowledge and listen to
everything around it as they figure out where it is.

Reminds me of a welfare youth who stole a ham ht in Balt.
I heard Wa3TUN talking to 'Trashcan', the youth's radio handle
on the local 2M repeater. Wa3TUN was A Balt city cop!
Wa3tun Made friends and he met up with the little slimeball and
recovered the radio. If you are going to play with an item
you better know what you have or you go to jail.

Does anyone outthere have a manual for a BC200XLT? I'd be willing to pay for a copy. I just bought a used one and it didn't come with a manual.

Also, the MFG Date is coded on the back...OEIO...can anyone decipher this? How old is this unit?

The unit seems to step by 12.5 in the 800Mhz range...can this be changed?

I'd appreciate the help...replies to my e-mail or this newsgroup...thx...Kerwin

805. AR8000 ERROR

Newsgroup: rec.radio.scanner
Date: 1995-01-20 07:42:30 UTC
From: bbjamin@aol.com
Message-ID: <3fnph6$nab@newsbf02.news.aol.com>
Source record: 262724

Has any AR-8000 users experienced a high rate of "PLL-ERROR"'s even after changing the time constant to 40ms, I still experience a high rate of PLL-ERROR . I think it might have something to do with the cool air, any Ideas?!?!?

Also... when receiving an 800Mhz freq. the incoming voice sound broken (even know it is a strong signal), however, once I manually open the squelch, the voice sounds great! what's the deal!? It almost sound like the squelch can not decide to open or not!

Thanks

I have read also that this is a weak area on the radio but I haven't noticed
the weakness here myself. I am sure that you could strain the plastic enough
to break the bnc off at the plastic so I am very careful in this area.
Grove has what they claim to be is one of the best rubber antennaes.
I'm not sure of a part number but I'll look for info this weekend.
Vic, I think we spend too much time at our computers. I use your great
WWW page and I see you on IRC and here and there. Question? Does your
wife (if you are married) get angry because you spend hours upon end sitting
at your computer? Mine doesn't.....;) NOT
You are becoming one of the most informed people on the net in regards to
the GREAT AR-8000. I have many questions and every time I turn the thing on
I wonder if I have things set up optimally. Things that you can only set
in the expert mode and the optimal battery save settings are just a
couple that come to mind. PLL lock times, etc, etc.
How about your Audio Squelch? I can't really tell if mine is working
correctly as the scanner still stops on signals with no voice
modulation. I know that it can't diffrentiate between some carriers but
I really can't tell if it's working at all. I do know that initially
there was an audio squelch problem but mine (according to Javiation) is
on of the newer ones that has the factory modification. (serial # is higher)

Thanks
dfleming

810. Outside aerials for 39

Newsgroup: rec.radio.scanner
Date: 1995-01-20 09:58:53 UTC
From: dpfg@ukc.ac.uk
Message-ID: <5962@rook.ukc.ac.uk>
Source record: 262713

2 questions:

1) I have seen it suggested that wiring an outdoor aerial up to a handheld scanner eg. Pro39 will overload it. Is this true?

2) Does connection to a Yagi TV aerial produce acceptable results?

S1 out

I use the computer at night when she is asleep. The vic on irc must be another
vic because i don't know how to make irc work using tia-slip. During the
day I occasionaly look to see if there is new email or while doing something else
the email gong goes of and I see the new messages.

> You are becoming one of the most informed people on the net in regards to

To be quite honest I do not know the answers to your questions that you asked.
I will see that they are posted to the info page as soon as I spot
the answers myself or someone writes with the info.

The audio squelch has in particular puzzeled me. Also I had the radio
sending data automatically to the computer when ever the squelch
opened while scanning or searching using the LC and MG commands.
It dosn't do that any more. I believe that I have changed some
setting that has messed up that feature but for the life
of me I can't figure out which one it was. Anyone?

814. Automotive holder for handhelds?

Newsgroup: rec.radio.scanner
Date: 1995-01-20 12:09:25 UTC
From: Victor Healey Ki4je <vhealey@crl.com>
Message-ID: <3fo95l$4ic@nntp.crl.com>
Source record: 262723

Please look at page 62 of Newsweek Jan 23,1995 southeast
edition. There is an ad that features a cell phone
holder that may be ideal for the ar8000.
Basically it plugs into the lighter socket and the
scanner/ht/phone clamps into holder. I like the idea of the view
angle which is essential to the ar8000.
Cost by mail order is $40.

Has anyone seen these at a local retail outlet?
Has anyone tried one with a scanner?
If the antenna gets in the way you could use a mini
mag mount and plug your rubber duckie into it and the
line into the scanner.

This item might even be neat with one of those large
emergency battery packs many hams have. I have one with
an amplifier and a place for a ht to clamp on the
side but it would be nice to have the scanner clamped to it also.

One would really look weird carrying that around! <grin>

>:that way...things that they may not broadcast but know about.
>
>Does anyone have any actual first or second-hand accounts of this? Seems
>that this strikes high on my interesting meter.

I used to listen to these broadcasts in the 450-460 range. To find these frequencies put your scanner in SEARCH mode about an hour before local stations go on the air with their news programs. They are usually setting up for the local shots about this time. Also, if there is a special event that you have prior knowledge of and know a local station will be broadcasting live from it, you can search at that time.

If you monitor these frequencies you have the added fun of watching how director commands influence the on-air personality during the actual broadcasts. For example, you can watch how a reporter suddenly gets kurt during an interview when the director commands him/her to "wrap it up". The commands are transmitted on these freqs and are funnled to the on-air personality through the little white earphones you always see curling into their ears.

One thing to note, CELLULAR PHONES are quickly replacing these utility channels used for this purpose. At about the same times I mention above it is advisable to search the cellular bands (or their images for later scanner models) to hear this traffic.

Hope this helps!

They may "look" alike, but the PRO-39 and PRO-43 are very
different radios inside. The PRO-43 employs up-conversion
and has a high level of image rejection.

Again, The People's Republic of New Jersey :-) recently modified it's law. You can have the scanner in the car without a permit, but you can not use the *information heard on the scanner* to commit a crime or elude capture. If you have a scanner in the act of doing nasty things, it is an additional charge. Cite: NJSA 2C:33-21 "Interception of Emergency Communications to Facilitate Crime" and NJSA 2C:33-22 "Unauthorized Interception of Emergency Commnications During Crime".

The only equipment-specific statute left is 2C:33-23 which exempts "radar devices used to monitor vehicular speed".

That's about the going rate, more if you have to have it cut special.
FWIW, I have an ancient Craig 8 channel xtal scanner and got the freq
I needed from Crystek. They have (had?) an excellent database on older
scanners - I gave them make, model, and serial number and *they told me*
the particulars of series/parallel resonance, fundamental, IF, etc.

It's OK for close in 2M repeater or simplex operation, forget it
as a scanner antenna since it really is meant for close in work, BUT,
if you're in a RF dense area it could help solve some image problems.
It's tuned for 144-148 Mhz , is nothing more than a short coil
and capacitor at a resonant tap point off the coil, so it's
performance will drop off sharply either side of the intended
band.

>shortwave. Looks like I'll have to put the next one outside.<G>

A few newbie questions:

1. I have a two storey structure with a cedar shake roof.
Would there be much difference between mounting a RS discone
inside the attic versus outside on the peak of the roof.
(Vancouver's rainy winter + shake roof = long slide of doom) :-(

2. Any recommendations for a CB whip to mount on the center
stud of the RS discone to make coverage more complete?

3. I also have an old TV antenna kicking around. Assuming I can
squeeze it through the itty-bitty hole into my attic, and get it mounted
sideways, is there any other alignment I must do? ie. Is this thing
directional in the horizontal plane?

4. How do I tie all this hardware together? Do I just daisy-chain
the coax and bring one lead into the house, or is there a more
exact science to follow?

Thanks a bunch for your input.

..Gary

829. PRO-43 Intermod Problem

Newsgroup: rec.radio.scanner
Date: 1995-01-20 17:12:49 UTC
From: jim@ttech.com
Message-ID: <jim-200195210535@jimsmac.ttech.com>
Source record: 262577

I recently took my PRO-43 on a trip to Aurora, Illinois. The Aurora Police use a frequency of 155.610. This is the first time that I have used my scanner in this VHF frequency range. I was plagued with intermod from paging transmitters and had to turn the squelch all the way up to monitor this frequency. Has anyone else experienced this problem? I thought that a triple conversion receiver was not supposed to suffer from this problem.

p.s.

It is not a problem with my radio, as I tried another PRO-43.

Any input will be appreciated. Please respond via e-mail.

thanks,

+-jim

At the current time I don't think there is any viable means to monitor police mobile data terminals. They use a proprietary data format, so they are essentially encrypted (although a real hacker could probably figure out the format).

833. Need help identifying strange signals in 454 MHz band

Newsgroup: rec.radio.scanner
Date: 1995-01-20 17:35:19 UTC
From: kg5ai@w5ac.tamu.edu
Message-ID: <3fos8n$mrv@news.tamu.edu>
Source record: 262615

Hearing some strange signals in the 454 MHz band the past few months.
They are NOT aircraft related nor do they seem to be phone/pager related.
Specific freqs here are 454.175, 454.250, 454.300, and 454.575 MHz.
The best way to describe the signals are that they sound like trunking data
channels (but not exactly). The 454.175 one sounds like is is *busy* for
lack of a better term. The other channels just have a buzzing sound.
Think I found the tower it is transmitting on. City of transmitter would
be listed as Bryan, TX. No voice on this at all. I estimate power on this
to be about 50 watts. Gets out at least 30 miles. Anyone else hear this
stuff or can look it up in a more recent database?

835. California code books

Newsgroup: rec.radio.scanner
Date: 1995-01-20 18:10:26 UTC
From: brett_miller@ccm.hf.intel.com
Message-ID: <brett_miller.90.00122D0F@ccm.hf.intel.com>
Source record: 262547

For those in California who are interested in knowing what violations are being listed over the air, here is some good info. These books are sorted by section number, so when you hear "wanted for 187, 459, etc..." you can look up what the violations are.

There is a company called LAWTECH publishing that makes very affordable reference books. Their latest mailing has:

1995 Penal Code Quick-Code Law summaries $9.95
(this is like a booklet with summaries of most laws by section number)

1995 Vehicle Code Quick-Code Law summaries $9.95
(quick reference booklet of vehicle code)

1995 Penal Code (abridged) $13.95
(paperback size about 1 inch thick)

1995 Vehicle Code (abridged) $13.95
(same size as Penal Code)

1995 Drug & Narcotic Codes (abridged) $11.95
(I've never see this one)

Their nuber is 1-800-498-0911

LawTech publising Co., LTD.
31921 Camino Capistrano #152
San Juan Capistrano, CA 92675

I have no connection with this company, I'm just a satisfied customer. Some bookstores may carry these books also (you can save the shipping charges). I don't think they have codes for any other states, but you could call them to see if they could put you in touch with someone who does.

> happenening?Didnt think think it would be possible for a PRO43 to do as
> they claim?

Well, they e-mailed me they were going to have the mod posted in
either MT or Pop Comm and offer an address for the mod for those
too squeemish to disect their own radios. As long as the processor
allows, any scanner cant count up/down to an internal limit, but
the sensitivity will be non-existent to poor in the new regions. I'd
hoping to be able to do what they claim, it would certainly give
an added value to an already outstanding scanner.

I wonder if Bob Parnass has heard of this mod?

A word of caution: I purchased a similar device and thought it would work great, but after installing it realized it interfered with my stick shift. Some floor mounted automatics might also get in the way. I puchased mine locally and was able to return it right away, but if you order by mail and have a shifter that might get in the way, you might want to investigate this potential problem first.

For those interested...

I posted a shareware control program for the ICOM 7100. It requires a PC, windows, and a CT17 compatible interface. To access the program ftp to oak.oakland.edu. The program is comm100s.zip and is in the /pub3/hamradio/pc/ham-utils directory.

The program controls most of the front panel options of the 7100 and will keep track of the frequencies during logging. Additional features include increased speed by using the computer as a controller for scanning.

Bummer I went ahead and ordered it after I checked
Rat Shack. I had seen something that looked like it when
wandering around the store. Turns out it may be similar
but theirs bolts to the vehicle and has no power supply
option.So I ordered out of the 1-800 number. How much did you
pay and was it sturdy enough for a scanner or ham ht?
If worst comes to worst I can use it with cell phone.

Vic Healey

PS

Quick pointer to Japanese Quake Info placed on ar8000 & more page
for those looking for pictures, list of injured and other info.
ftp://ftp.crl.com/users/ro/vhealey/www/ar8000.htm
The pointer is temporary and wil be deleted when interest in the
quake dies out. Also saw that NBC news tonight said that
Calf quake certainty updated today. I vote that uninsured
people who choose to live there do not get any government
handouts to rebuild in the same area. If they want to be made
whole after the certain destruction they must carry their own
insurance before hand. IMHO

Sony hit by quake. See chain of pointers.

I was told that the UK mod. had a step of 12.5 when scanning the cell range
and that other than that the bandplan was identical to the US .

RE the bounce. Are you refering to the fact that when you turn the dial to manualy change the chanel it will skip over a few chls and then stop on one. If so you are probably in scan
and if you are in [scan mode] try hitting the [scan] button until you see M.RE in the upper Left corner of the vfo and then try tuning the chanel with the dial.

If not and if i'm way off please inform me as to what is ment by the "bounce" problem please.

400 chls in mem, 600 to go :-)) ~runing out of things to monitor~ ;-)

The best thing for you to do is to get the antenna outside. The body of your car is blocking almost all of the signal. You can get an outside antenna that looks like a cellular or CB rig. You can get clip-on or magnet mount antennas that you can put in your car when you are parked so it wont alert the theives, and it's made for CB's so the cops won't give it a second look. Works great with a short coax cable leading to your hidden receiver.

You must be joking. It's been repeatedly posted on here that no internal mod is needed with the 7A4 (and I've verified this)!!!!! It's the 8A4 units with the FCC ID ending in 20-308A that would need some kind of internal mod. With the 7A4 units you just need to do an additional step with depressing keypad buttons.

>I was wondering if anyone has had any experience with this antenna, and what
>your thoughts on it were. Thanks a bunch....

No personal experience, but word in the local Ham community isn't too
favorable...the popular saying is that it's called a "Miracle Baby"
because if you can hit the repeater using it, it's a miracle!

Seriously, if you need an ultra-compact antenna for short range communications
(say, around a Hamfest), this may do just fine. Otherwise, I'd skip it.

Your mileage may vary, and, as I said, this isn't my personal experience...
just what I've heard...

Cheers,
Tom

A car hit and totally trashed a pole. After the fire deptartment arrived they called for Ohio Edison to come out. The dispatcher asked the fireman if he had the pole number. "Not any more" was the reply.

***

The Police dispatcher put out a call about a man urinating in the middle of the street. The officer that got the call decided that it was 'screw with the dispatcher' time and made it appear that he didn't hear the call due a radio problem. After the dispatcher repeated the call three more times the dispatcher finally screamed "there is a man pis*ing in the street. A few seconds later the watch commander and told the dispatcher to find someone else to dispatch and he would be in to talk to him.

***

A few years ago, an EMS call went out for a man that OD'd on Preperation H. Later the same ambulance was diapatched to another call and asked dispatch how the OD call. Dispatch said "it all came out in the end."

Does anyone have any information on the Motorola MTX9000 radio? Is it a single frequency or trunked unit? Is there a way to read the frequency from the LCD display?

The radio has a rather small flexible antenna, so I am assumming that it is either in the 450 or 850 Mhz range.

Message-ID: <c570074.2.2F208479@mizzou1.missouri.edu>
Source record: 262541

I'm looking to buy a not-too-terribly expensive 800 Mhz-capable scanner. I don't really care if it's handheld or base/mobile, but I'd like it to have at least 50 channels and the 800 Mhz band, in addition to the standard ranges. Air band and cellular mod-capable would be nice, too. I'm a bit flexible on price, but I don't want to spend $200 or more. Cheaper is better.

Any offers, please let me know. Thanks

>Any one know how traffic copters transmit to radio stations. I would
>like to see if one can monitor these conversations while they are "off
>the air"(so to speak). Are these transmissions monitorable and if so,
>what freq should I try?

They would be in the auxiliary broadcast service. Probably considered low
power auxiliary stations. So you might find them in these areas...

(all in MHz)

26.100 to 26.480
54.000 to 72.000
76.000 to 88.000
161.625 to 161.775 (except in Puerto Rico or the Virgin Islands)
174.000 to 216.000

450.000 to 451.000 (A good bet in the SF bay area. Try 5 MHz up for inputs.)
455.000 to 456.000 (Like I said, 5 Mhz up)

470.000 to 488.000
488.000 to 494.000 (except Hawaii)
614.000 to 806.000
944.000 to 952.000

But remember... you aren't supposed to listen in on auxiliary broadcasts.
(Now I'm off the hook)

And before all of you with freq spectrum allocation charts tell me I am wrong
about some of these please remember that they may (might) operate as a
secondary service on some bands.

>Also, I have noticed that many fast food places have drive thru order
>takers that wear cordless headsets. Don't know how interesting it would
>be to listen to but does anyone know the freq of these as well?

There is no specified fast food radio service. Try the private land mobile
services - most likely the business service frequencies - KFC might be
eligible to use the petroleum radio service, who knows? Business radio has
frequency allocation all over the place between 27 MHz and 10 GHz. But please
don't start a fast food thread with every McD's freq you've found. God help
us all.

Yes, Glen is correct. I live in the NYC metro area, and once they announce "wheels down on AF1", almost all comms are scrambled. There are some exceptions if they have radio problems, etc. When "eagle" comes to New York, I monitor the NYPD's channels, because they are never scrambled and there is where you find the action anyway. ie; rooftop searches, motorcades progress, checkpoints etc.

Bundy- Please tell Glenn that I said hello. I was on assignment in the Bay Area for around 18 months back in 1991-1992 and visited Glenn's store at least every 8 weeks or so and purchased a number of Glenn's publications on local freqs. He's got a great store and is a very nice guy! Thanks,send him my best.!!

Good point! Natural disasters occur everywhere, be it tornados, hurricanes, floods, etc. However, the most recent studies indicate that California is certainly more prone to this type of disaster than other areas of the US. While you shouldn't lose any sleep over it, a well thought out emergency plan would certainly be a good recommendation, So, if disaster strikes, you will be able to tilt the odds in your favor of survival!!! Trust me, we find that we are in a precarious situation every fall when the Atlantic Ocean and mother nature presents us with hurricane season. We have back up battery power, food, watrer and blankets in the event of a hurricane reaching our area!

No question that you will see a noticeable improvement in your reception. You may have to turn down the squelch. Try to minimize the length of cable that you use to connect to the radio to minimize signal loss. I have the Radio Shack all band discone runs from 2-1000 MHz. Works fine! Enjoy the listeening!

870. Super-Bearcat 2500XLT or dealer scam?

Newsgroup: rec.radio.scanner
Date: 1995-01-21 05:36:29 UTC
From: eskin@btree.brooktree.com
Message-ID: <3fq6gt$cpl@btree.brooktree.com>
Source record: 262613

My local scanner dealer is really hot to sell me what he describes as a "Press version" of the BC2500XLT. He claims it has faster scan speed (120 vs 100 cps), greater audio output (1 watt vs .5), better receiver (something about digitizing the audio data for spread spectrum decoding for Federal use), and continuous coverage (no cell lockout).

The dealer has a pretty good reputation, but I can't find anyone else to validate that this unit really is what he claims it is. I can't by looking at it tell it from a modifyable older BC2500XLT with the mods preinstalled. He's asking a small fortune for the units, claims that he sells many to UPI, the Navy, and other federal groups, but I really don't know whether to believe him or not.

Anyone have any idea if this is really what he says it is or am I just being scammed? Did Uniden manufacturer some special-purpose scanners that are finding their way into the private sector?

I'm pretty seriously considering buying one of these if he's telling the truth, but I'd really appreciate any advice or information anyone on the net can give me.

mpalinsk@industry.org wrote:

: alright, someone explain what a PL is...

Put simply, PL is a Motorola term for CTCSS, or Continuous Tone Closed Squelch System (or somthing like that).

CTCSS allows for a sub-audible tone to be transmitted with whatever else is being transmitted. Because you can't hear it, you don't know it is there and it doesn't interfere with your transmission.

On the receiving end, you can do several things with it. First, you can set up your radio to receive only transmissions with the tone, allowing you to "filter out" transmissions from other radios who are not transmitting the tone. This is good in areas where several companies are using the same frequencies. It can also be used as a method of limiting access to a repeater. Only those who know the CTCSS frequency (and use it) can trigger the repeater. Also, by telling your radio that you want to hear transmissions with a particular CTCSS tone only, you can eliminate most intermod as well.

The 2SRA can be set to sound an alarm when a particular tone is heard. This could be used for signalling a group of HAMs for example.

Hi.

I purchased a 890xlt a bit ago. I have just moved to Toronto, from the town of Guelph. In Guelph our police/fire/ambulence systems were very simple and allowed for very simple monitoring.

I have the Haruteq scanner book, and looked up the freqs for Toronto's police. That was a mess...lots of tones being spewed all about, which didn't allow for easy scanning. The tones were only temporary and each channel would come back in a while, so it wasn't useful to just lockout channels. How does this 800mhz system work...does it us a PL tone? I have a PL tone board in the Bearcat. I used to succesfully listen to the OPP this way.

Can somebody help me with the Fire dept too? Most of the freqs I got out of the book have lots of static...bursts of it and nothing clear. Can somebody give me a list of the channels I should monitor for the downtown Toronto area...or maybe which ones I should ignore in the haruteq scanner book. Do the fire dep use PL tones?

Can anyone give me some help with all this? Any help will be much appreciated!

knob-:With the 7A4 units you just need to do an additional step with depressing
knob-:keypad buttons.

Seconded! I just got a 7A4, and you need to do the 2/9/band
first, then 2/9/l/o to get the 888MHz freq in channel 23. Presto! It
works! I had an 8A4 and it didn't have the brown wire, and the keyboard
mod put 857MHz in ch. 23. As far as I know, 8A4s are not modifiable
(~easily).

Hi,

I was wondering whether anyone knows if the AOR AR8000 can be purchased in Japan (It is made in Japan isn't it?). How does it compare with the UK or US model in regards to what it can and can't do? How much is it retail out there?

Thanks for any help,

Bryan.

889. AR8000 & Macintosh

Newsgroup: rec.radio.scanner
Date: 1995-01-21 20:16:34 UTC
From: RAlpert@qm.ATTAIN.com
Message-ID: <RAlpert-2101951516340001@0.0.0.0>
Source record: 262554

Does anyone out there have an AR8000, the computer interface and a Macintosh?

I am working on a program to interface the Mac to the AR8000 and would like to know who, an any, fits this catagory.

Right now the program allows you to enter frequencies, modes and text for each scan bank.

I will be expanding it to do much more, but I have little experience with scanning and I don't know what features would be important.

I will be adding in search banks and scan and search linking.

Are people interested in fully controlling the AR8000 or do you just want a program to store, upload and download banks, or a combination or both?

Thanks for the input,

Robert Alpert

A few days ago I posted a message that a friend of mine had successfully modified the PRO-43 to store 400 channels rather that the standard 200 and invited those interested to email him. I have had a couple of people email me that they tried to contact Brett and I apparently misposted his address. I called him last night and he said to use the account he accesses from home. Here is the correct address:
bbb@kuhub.cc.ukans.edu

His name is Brett Bennett. He will be glad to send you the article he posted on the mod several months ago.

Why do you make this out to be so 'underground'? The alpha page OTA protocols are published animals and there are commercially available packages to decode the messages directly off the air (and have been for quite some time) either on a 'per capcode' or 'total channel' basis. The commercial packages give carriers the ability to maximize channel efficiency, among other troubleshooting aids.

It's not illegal to divulge what you hear on a scanner to a third party. You're confusing that with listening to cordless telephone calls.

In the specific case of police and fire are public agencies: You have the right to listen in all you want and to talk about it all you want to anyone you want. No, the newspaper is not bending any law in any way; no it is not a loophole.

Assuming that you agree that you can buy a cheap but decent frequency counter (which ain't necessarily true), then I would suggest the Optronics 3300. Sells for about $130. Unlike the Rat Shack model, it has a hold button, which is essential. You can modify the Rat Shack with a hold button; there have been some instructions to do that floating around here.

899. Scout Model 40

Newsgroup: rec.radio.scanner
Date: 1995-01-21 22:59:25 UTC
From: wa1omm@aol.com
Message-ID: <3fs3kd$cvr@newsbf02.news.aol.com>
Source record: 262571

Just a note regarding my new Scout ...

I purchased a Scout Model 40 from Amateur Electronic Supply. The unit arrived with an AC90 9v 500ma charger/adapter, an 8 1/2" x 11" manual containing 12 pages of user information and a two page quick reference guide (last page of the manual), a belt clip (apparently permanently attached to the rear of the Scout), a 3.5" floppy containing a program called SCOUT.EXE that allows downloading captured frequencies from the Scout to a DOS text file, and a short stubby antenna. The latter was contained in the Opto packaging, so I assume it is standard with the Model 40 now.

Taking the unit out of the protective packaging, I was immediately impressed with the rugged design and solid feel. The unit appears to have been designed to absorb some abuse.

First thing I did was attach the antenna and plug the unit into the charger. After about 90 minutes, the CHG STATUS led began blinking indicating that the charge was complete (nice feature).

After taking a quick glimpse at the manual and familiarizing myself with the boot configurations, I sampled a few of my transmitters to verify that the calibration of the counter was accurate (and it was). As several folks have already done in the forum, I booted the the Scout in vibrator mode, stuck it in my shirt pocket and headed down to the local mall to check out the activity. If you've never used a vibrating pager or Scout in your shirt pocket before, I suggest experimenting in private. The first "hit" gave me quite a startle!

A brisk walk through the mall produced all sorts of activity near the entrances to various stores, particularly the larger ones. I had several hits in the 902 MHz and 903 MHz ranges. On the way home a couple of cell phones produced some hits in the 835 MHz range, as well as a fairly powerful paging system on 454.177 MHz. The Scout seems to perform as advertised even with the little stubby antenna.

Prior to powering off, I put the Scout into SLEEP mode to save the data before turning off the unit. I also discovered later that when the batteries are about to die, the unit automatically goes into SLEEP mode. When the latter occurs, a small dead-battery icon appears in the display.

I also verified that the Scout does indeed control the frequency of a CI-V device such as the Icom IC-R7000. It worked just ducky. I also tried the SCOUT.EXE DOS program supplied with the Scout. Unfortunately, the software would not communicate with the Scout when run from a DOS

window in Microsoft Windows. I could only get the program to communicate with the Scout by running it under DOS.

Overall, I am pleased with the unit and expect to get a lot of use out of it.

Well,

What you want ot know??/ Each system works differnet, has
different ID's, Talkgroups, fleets, subfleets?????
ALL systems have a 4 digit ID such as 1K2S
THEN each company or Dept. has a talkgroup or fleet such as 0074
or 014F

Afterthat???

CARL

In Atlanta the 2 competing traffic info providers are in the 450 Mhz range.
Metro Traffic Control uses 450.3875 Mhz. BTW all the local TV news operations
are in the same frequency range here also.

From: alee@crl.com
Message-ID: <3fsco0$ipk@crl4.crl.com>
Source record: 262626

The internal battery in my ICOM R1 just went dead. I opened up the unit and there appears to be a simple battery pack inside (6 batteries in a battery pack). What is the voltage output of the internal battery pack, and can I use cordless phone packs from Radio Shack to replace it?

Also, if anyone has a base cover to the R1 (I use an extended pack battery and lost the original bottom plate to the R1), I would buy it from you for $20.

All responses to alee@crl.com

I was under the impression that if you prophet from any information gained from listening from a scanner you were in violation of the law. Since the media uses the information gained
to make a buck are they not in violation?

I get very good reception on the low band with my AR8000.Also the Rubber
Duck on the AR8000 is NOT VERY GOOD period. Even the rubber duck on the
PRO43 works better to my understanding.The duck on the 8000 is mediocre.I
can use the radio Shack telescoping antenna with little INTERMOD. I
couldnt before when I had a AR15000. :-)

Then again I cant afford to have both scanners and compare but I do have
a PRO2006.

ar8000 PLL-ERROR problem
Has any AR-8000 users experienced a high rate of "PLL-ERROR"'s even after changing the time constant to 40ms, I still experience a high rate of PLL-ERROR . I think it might have something to do with the cool air, any Ideas?!?!?

Also... when receiving an 800Mhz freq. the incoming voice sounds broken (even know it is a strong signal), however, once I manually open the squelch, the voice sounds great! what's the deal!? It almost sound like the squelch can not decide to open or not!

Thanks

:look up what the violations are.

: There is a company called LAWTECH publishing that makes very affordable
: reference books. Their latest mailing has:

: 1995 Vehicle Code (abridged) $13.95
: (same size as Penal Code)

Not to impugn either Brett or this company, but this is not only a rip-off but it is inaccurate. The 1995 Vehicle Code won't be published by the State until March at the earliest since it will include all of the laws passed in 1994. What the company may mean is that this is their most recent (95) edition. As for the price, the last time I bought a Vehicle Code from the DMV it was only $5 and that was only a few years ago. Noone should have trouble understanding the Vehicle Code without interpretation (although most of it is *deadly* boring) and as a handy bonus it includes a handy guide to the "popular" sections of the Penal Code, Business and Professions Code, and other things that police officers are likely to refer to on the air. The CVC should be available from any local DMV office, but I suggest calling first since they might be out (they know you're coming).

Good Luck,

Doug

Regarding radio transmissions that, you here it is against the Federal Law to:

<<Reveal to_ any_ other person, not a party in the transmissions, the
contents of those transmissions.
(in other words keep it to yourself)

<< use any information heard in committing a crime.

<< Use any information for personal gain.

It is also a crime to_intentionally_intercept the
following types of transmissions:

<< Remote radio-TV broadcast pickups.

<< Scrambled, encrypted or coded transmissions.

<< Mobile telephone conversations of any type.
(I believe this has been updated to include cordless phones too.)

The above wz taken from 1994 Rat shack Police call scanner
listeners section. Though I would not take the info as gospel though
I do believe it does have merit to it.

This is not legal advice in any way, but I've keep it in mind when
repeating certain info.

For those who are interested in such things, there is a whole hierarchy dedicated to amateur radio. Look under rec.radio.amateur.* A post like yours looking for general info would probably go best in .misc.

I decided to post this instead of replying by mail because I have seen several "ham" questions here in the last few weeks. I will also confess to a bit of proseletyzing since scanning was my introduction to the wonderful world of amateur radio. I am still new to the sport, but thoroughly enjoy it. It's a fascinating transition to go from being a listener to the action, to being a part of it! I would encourage anyone who is even a little interested to go for it. You would be amazed how easy it is...

[commercial mode off]

Good Luck,

Doug

Joe.....Do you have any documentation on the legality of mobile scanners in Kentucky for Hams?!?!?!?!?!?
I remember an ARRL bulletin that stated that they were the last state to come aboard the new concept, and when I inquired of them for the info, they sent me info about the legality of our ham equipt. receiving the public service b'casts, but nothing about scanners!!!!!!!!!!
I have a vested interest in your reply..... A couple of years ago, before I became a ham, I had a BC760XLT confiscated at a Truck Weigh/Inspection Station.....I drive trucks and play with radios for a living!!!.....Anyway, it was confiscated without a property receipt or any form of due process. I now drive almost exclusively from Ks to L.A. and don't have any
problems at all ...even in The Peoples Republic Of California....!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
BUT----- I'll be taking a load thru Ky this Tuesday, and I'm PARANOID of losing my seven scanners to the long and myopic arm of the law!!! So, any documentation or other info you can pass on will be GREATLY appreciated!!!!!!!!! I'll check for a posting here or at my E-Mail address listed above.
73's, and thanx...

Since others indicate that this is associated with low batteries
has it occured to you that if you are using akaline batteries
that they may be low voltage due to cold. I am not sure if nicads
are also adversely affected by chill.

Try using a set of fresh batteries.

937. Alpha programming the BC8500

Date: 1995-01-22 13:57:53 UTC
From: mpage@netcom.com
Message-ID: <mpageD2t84H.IAC@netcom.com>
Source record: 262660

When you make a mistake while programming in an alphanumeric screen on the BC8500, is there any fast way to make a correction? The only way I have found, so far, is to get out of prog and start over on that entry. No correction or arrow keys.

I have also found that I can program in an entire freq, alpha & squelch code (and all have been saved), but the radio will loose it. I have to go back and do it again.

: Maybe you already noticed this but today I realized
: that to get a dump of all data in a term program by banks
: MAA
(stuff deleted . . .)
: just cut and paste that to the scanner and capture all the responses.
: Previously I did MRA00 etc to loacted a bank then MA to get data.
: Not needed. You can cut and paste the whole column in one shot
: the scanner will handle each query in turn properly.

Sounds great, but don't you have to clean up the resulting data file
still? (I mean to remove the "MAx" stuff and the AR8000's output from
empty banks).

It seems like we should be able to trick the radio to do a "clone" dump.
This would be perfect for a "backup" of the radio.

Dump the rubber antenna and get (if you want to...;) the rubber ant. that
Grove sells or get the Radio Shk. telescoping antennae. The Radio Shack does
work very well and is only 9.95. If you want cordless freq. you should
collapse the last two sections. Using the signal meter on the 8000 you can
see a great improvement.
The antenna seems to be about the only weak link of the 8000.

Hello all,

I received a small Bearcat scanner for Christmas and I'd like to get another battery pack for
it. Does anyone know where I can purchase such a thing?
Since the unit *always* has to have the battery in it to function (even when it's plugged into
the wall) I figure I better get a spare.

: Javiation is real nice with see thru plastic windows on front and side
: and it seems to be padded for extra radio protection. Price id 17 pds.
: Sterling. (about 25 bucks? I think)

I have tested several rubber duck antennas using the AR8000 and AR3000A and
have found that a 800MHz cellular antenna out performs the 200xlt, pro43,larson
2mtr, icom 2mtr, Diamond 2mtr and austin condor antenna on all bands. I don't
know the manufactures name because I bought it some yrs ag (it is not a RS
antenna, I am thinking of purchasing it to try it out too). It is not much better than the
Diamond or the condor on all bands. It is better than the diamond
and the condor on UHF and 800MHz and about the same on VHV lo and VHF hi.

I hope this helps

> Isn't it illegal to divulge what you heard on your scanner to a third
> party?

> I know the media listens to scanners all the time; are they bending
> the law or is there a loophole for them?

I don't think anyone has ever really gone "all the way" with a case against a newsgathering organization for violation of the Communications Act. The press have always stated that their First Amendment rights cover reporting based on scanner intercepts. To my knowledge, the US Supreme Court has never been given the opportunity to rule on this. (Under the current political climate in the USA, requesting such a ruling now might be VERY dangerous for personal liberties.)

It does appear to violate the spirit of the law to ask citizens to violate the Act on behalf of the media. I guess if they don't pay any of these people, there may not be much to prosecute. There is probably no real proof of involvement by any individual with that arrangement either.

I saw a similar ad here in Rochester, NY once. I called the number and left a message inquiring about the legality of such activity. They never called me back. :-)

WOW! Where do you get your [mis]information? It most certainly is
illegal in the USA to divulge intercepted radio transmissions to third
parties. Read Section 705 of the Communications Act of 1934.

From: MarkCJones@mcjones.demon.co.uk
Message-ID: <MarkCJones.4.001DA2F1@mcjones.demon.co.uk>
Source record: 262671

What is the optimum charging time for the PRO-43, and for how long should the charge last?

I am using a 9V 800mA regulated power supply to charge 6 standard Radio Shack Enercell NiCd batteries within the scanner, but only seem to get about 30mins use before the batteries go dead.

The manual is not clear in this area, so any help would be appreciated.

Mark.

>If you have UK PRO-37 you can obtain 29-54MHz coverage (although you may
>loose 66-88MHz I'm not 100% sure if yu can have both !).

When you do this sort of thing, does the display read the actual frequency
being monitored, or would it say 66 and receive 29, for instance?

>you can add an external switch to allow AM to be switched in outside
>the VHF airband, the latter involves a little "work".

Is this also possible on the Pro39? Presumably if the thing is inherently
capable of getting AM (for airband) it is not beyond possibility to
generalise coverage?
Does the existence of AM circuitry for one bit explain why some sort of
signal, allbeit not very good, is heard when listening to an AM transmission
when in FM mode?

Thanks for the great response, the comparison was done with a Diamond-RH77CA all band on both radios. The Pro-43 will BOOM the signal and the 8000 will be almost unreadable. I have lots of scanning years, so I'm pretty sure the mode and steps and stuff are set ok. I'm concerned that it is my particular unit and not inherant in the beast

Actually it is only illegal to divulge private conversations, such as
cordless or cellular phones(which actually are illegal to listen to now).
Police and fire are considered public, therefore everyone can talk about

Does anyone have a list of the Conn. State Police Frequencies. I have a list that every time I pass thru the state I seem to get everything except the Conn. State Police. I was also in a store yesterday that carries books and both these books had different frequencies. One had numbers in the 42.XX range while the other had "NEW" 800 frequencies.

Please either post or send me e-mail.

Thanks!

Stuart

> I've heard QVC audio.

Yes you can get cable network audio on a scanner -- but it isn't intentional - it often means there is a leak in the shielding on the cable line -- and can be accidental or caused by illegal cable hookups. The leak usually ties up frequencies at and around 155.745 MHz and is usually the audio for cable channel 16 or 17 (or somewhere around there).

It was a pain in the rear for the longest time when I lived in Jackson, Mississippi, because the county fire dispatch frequency was at 155.745 MHz and I constantly fought bleed-through from a cable network when monitoring it.

Your best bet if this happens is to call the cable company to have them find out where the signal leak is -- you'll get better reception of those scanner frequencies, usually better TV reception on cable, and save the cable company from being fined for signal leakage.

>: radio, harassed him, tried to have him charged. What they were

No, the radios were illegally confiscated. The federal government is
by regulation, law and case law the only level of government that can
enforce communications law. The FCC didn't confiscate the radios, the
sherrif did, having no right to do so - in other words, they stole them.
B
Furthermore, as has been quoted by me and others here, the applicable
section of part 97 of the FCC regulations allows an operator in an
emergency to use whatever means of communications are at his disposal
to request assistance. In fact, every part of the FCC regs taht I've seen
has a similar section, so they couldn't even claim he was operating
a non-type accepted commercial radio.

The FCC didn't elect to do anything to the ham, including give him a
notice of violation. The reason is, that according to FCC regulations,
common practice, and in fact case law, what he did was completely acceptable.

The resaon the ham didn't persue the amtter of the stolen radios is simple -
he couldn't afford the cost of taking the County to trial, and the
radios were replaced by a donation from other hams in the area.
.
>His radio was legally confiscated because all commercial radios must be

977. AR8000 Problems

Newsgroup: rec.radio.scanner
Date: 1995-01-22 22:12:10 UTC
From: stegner@richmond.infi.net
Message-ID: <3ful7q$q3p@lucy.infi.net>
Source record: 262489

I just purchased the UK version of the AR8000 from Javiation and have experienced the following problem during scanning. In scan mode the scanner stops on certain inactive frequencies with the rubber duckie antenna. The frequencies that it stops on change. In one session, the scanner stopped on 460.100 for about two minutes. After this it started to scan and stopped on 460.3250. Next in line were 860.9375, 460.650, 460.175, 460.6250, 450.2875, 460.200 and then 450.3125. Seems to stop 3 to 5 minutes on each and then moves on. Sounds like the squelch is not closing. Adjusting the squelch and setting sound squelch on does not help. Signals register as high as 7 bars. I confirmed that these frequencies were not active with my PRO-2006 and MVT-7100. If I connect to my attic discone, this does not happen. I do not think that they are birdies because it also does not happen when I remove the antenna. Moving the scanner away from my computer does not help. I am afraid that the scanner is defective. Has anyone else had this problem?
Also, when controlling the 8K with ScanCat, the audio for 800mhz freqs is distorted. Uploading and downloading work great. Does anyone have any suggestions?

In <3fp2l6$qv6@newsbf02.news.aol.com> dctrhappy@aol.com (DctrHappy) writes:

>Is it possible to start a radio station and simply broadcast it over a
>cell phone (paying for the time of course)? Obviously this would only
>cater to those w/ scanners. Or would you have the gmen at your
>doorstep..?

I heard a different question than some of those replying here.

I heard: "If I make a cell phone call to someone else, and that person
just stays on the line and says nothing, and I send programming/
radio-station transmission stuff over the cellphone, although the
cellular system is sending it to the guy at the other end, the
neat thing about this is that I am actually legally transmitting from
10 to 100 watts from a well placed tower in a hopefully populated
area to many people.

Okay, so it costs 20 cents a minute to tranmsit my radio signal and
eventually get it to another phone which noone is listening to, but
couldn't I tell all my friends: "listen in to cellular at 7PM on Sunday,
and you'll hear my radio special on how to make cheese!" ?

Let's see, an hourlong program at $.20 / Minute = $12 per hour.
Okay, not so bad. But could all of my friends hear my broadcast?

The answer here is yes, if they were close enough and the congestion was low.

If you did it late in the evening on Sunday, few cellular channels would
be busy, and therefore cells which shared the same frequency as the one
you were using would be idle, and you could probably transmit for several
miles, up to twenty miles if conditions were right.

You would be almost guaranteed that everyone in the same cell could hear
you, (if you were close to the cell, the cell transmitter _might_ decrease
trasmitted power, and if you were in a 120degree section of a cell, it
is possible that the cell site is using directional antennas to transmit
in your direction (although directional is usually receive.)

A cell size is from microcell (~ 1 block) to rural cell (~15-20 Miles)
in diameter.

Next becomes the problem of whether they could find the channel you
were transmitting on. Since the cell site tower is known, (e.g.
you park in front of a given cell site) the channels associated with
that tower change very infrequently (e.g. a couple of times a year,
depending on changes in traffic flow, etc.) so you could publish the
fifteen or so channels of the cell site to your friends and they would

have to scan only those fifteen channels.

There is also the issue of voice quality. Since the 'base to handset' channel is always easy to hear and clear, the broadcast station should be the landline phone, not the cell phone. Even still, music would be awful but voice stuff should be okay (try sending music over a regular telephone line.)

Finally the issue of legality-

you could argue that under federal law, your friends listening to you would be legal if you gave them your permission to monitor your transmission.

It may be against the policies of usage of the cell phone service provider, or against specific laws in your state or local jurisdiction.

Interesting idea though,
Mick

The scanner doesn't echo your commands.
It isn't like a BBS.
There is no garbage from empty banks in a capture file. After sending the
little note bank is empty the scanner erases the text with 5 or 6
destructive backspaces.

Neat radios huh! To answer your question, "NO" there is no way to read the frequency from the display. I've programmed about 45 of these radios damm near every switch, button and knob is user defineable(sp?) Anyway these are 900mhz SMR's Conventional and/or Trunked radios with backlit display and keypad for those that have 'em. With mine I can hit all my company's repeaters in the south San Francisco Bay area plus about 10 mtn top trunked repeaters and make phone calls from a handheld radio.......cool........

Actually it wasn't my radio. I was looking over one of the units our
security people use. One unit had a keypad and another unit didn't.
The one with the keypad had something like six buttons on it.

I got the guy to key up and thought I heard it around 450Mhz, but I
now suppose that must have been an image or bleed though. Do you have
a frequency range that I could scan through to find which frequencies
are in use?

FCC rules and regulations Part 97

97.119 Station Identification
(a) Each amateur station, except a space station or telecommand station, must transmit its assigned call sign on its transmitting channel at the end of each communication, and at least every ten minutes during a communication, for the purpose of clearly making the source pf the transmissions from the station known to those receiving the transmissions. No station may transmit unidentified communications or signals, or transmit as the station call sign, any call sign not authorized to the station.

This was taken from the FCC rules Part 97 current as of Dec 20, 1994 downloaded from the ARRL.

It sure looks like kerchunking is illegal and it sure looks like unidentified transmissions are illegal too. You can make brief transmissions to tune your equipment but you also must Id when you're done.

Hey! Check this idea out. Since more and more scanners are coming out with computer interfaces, how about if we have Scanner shops with Data dump stations. You could just select your area of interest (police, fire, etc), geographical location and a database would retrieve the frequencies, you ok them and it dumps it into your scanner. Bingo! your programmed for that area.

ok, ok, I know, it's been a long night.....?????????

FCC rules part 97.403
Safety of life and protection of property.

No provision of these rules prevents the use by an amateur station of any
means of radiocommunication at it's disposal to provide essential
communication needs in connection with the immediate safety of human life
and immediate protection of property when normal communication systems
are not available.

MTX9000's are Motorola trunked radios that only work in the 900mhz band. They can be used as part of a trunked system or part of a conventional system. There are three models: non-keypad, 6-button keypad, and full 12- or 15-button keypad. If you're sure its a MTX9000 it is definately operating in 900mhz.

I discovered that this was due to pushing the radio into a pouch
type ham radio carrying case. The wet suit material was abraading the keys.
Since i have the new case especially designed for the radio by a third
party the process has stopped and everything is fine.

Ki4je

Would someone please send me some email sumarizing the 'problems' spotted
and the various replies for each problem so they can be posted to the various ar800
data pages on the www. Full credit to whoever has the time an ability to
help with this minnor bit of information that needs to be collected.

I'll convert it to html etc and get it posted. Several sites in other
areas of the world are mirroring or plan to mirro the data that i have
collected. Interest in this radio continues to grow on a weekly basis.

I thought it would drop off after xmas but I guess I was wrong.

Bill,I got these from Radio Shack's magazine "Radio":

259.70
279.00
296.80

Also,many of the shuttle missions will carry radio amateur equipment on an
experiment called SAREX.From times to times,astronauts will carry on
contacts with ground based ham stations using 2 meters FM.I believe that
the downlink freq is
146.550.Please,someone correct me if I'm wrong on this one.

As for the first freqs you'll need a scanner like the Pro-43,wich has
expanded VHF and UHF military air frequencies

So before you use your HT out-of-band to call for help you'd better
make sure none of the following are nearby: pay phone, cellular phone,
CB radio, amateur repeater, amateurs monitoring a simplex frequency,
someone within shouting distance who could summon further help,
signalling mirror to signal an overhead airplane. Otherwise, no
fair grumbling if your HT gets taken away and you receive a NAL.

Source record: 262320

I finally modified my pro-43. It was not as difficult as I thought it would be; although it wasn't easy. The diode is extremely small. In addtion to the tools that were recommended in the "pro43.mod", I suggest using a magnifiying glass. This should really magnify what you are doing. This is great, I paid $100.00 (which goes for over $200 dollars used.)for this great scanner and now I have increased it's value by modifying it to receive the cell frequencys.

A word of advise: for those of you who don't have the confidence to do this mod, I suggest that you use a calculator as your confidence builder. Calculators uses the same technology used in the pro-43. Try to unsoder a small electronic component and resoder it. Keep on doing this until you feel comfortable enough to begin the modifcation to your pro-43.

Good luck to everyone.

I recived this tonight from Eddie Janusz, a longtime Speedx member:

>The management of SPEEDX has made the decision to suspend
>publication. In the short term, that was an easy decision;
>we don't have enough money to pay for the February issue.
>In the long term, January is supposed to be one of our *good*
>months! No way were we going to make it through June. So
>rather than cut corners or put out a slop product, they have
>faced the inevitable.

>Best wishes,
>
>Eddie

Sad to say that Speedx is no more. Founded in 1971, the club had enjoyed many good years and although I knew membership was not what it once was, I didn't know things were this bad. I'm afraid it's a sign of the times with the SWL Hobby as a whole seeing less and less interest every year it seems.

Effective with this months edition (January, 1995) the Speedx World of Utilities Electronic Edition that I have edited, will also cease.

I have no other information right now.

Thanks to all the Speedx members who supported the Club by contributing to the columns, and especially to those who sent material for my column, Utility Notes!

Oh,really?

97.119 states that "No station may transmit unidentified communications or signals, or transmit as the station call sign, any call sign not authorized to the station."

Also, kerchunking can be labeled as "jamming", "malicious interference", and is annoying.

As an Official Observer, and a Repeater Owner, I do not agree with you. Tell me where in "your" rules, you find that Kerchunking is legal.

It is unnecessary wear and tear on the repeater whether you want to believe it or not, and uses power needlessly. While some fool is kerchunking, someone else may be trying to make an Emergency call.

I detest kerchunkers. To say that it is legal, invites trouble.
We don't need "carrier throwers" (CB slang) to contend with. If you want to talk, do so (if licensed) otherwise get a license and then talk. It makes no sense to just push a button. Put out a call, if you aren't answered, then either you can't hit the repeater or it is on PL on receive or some other logical reason. Find out, then try again.
I don't mean to sound condescending or to get personal, but it is these sort of answers that openly invite problems and let those who like to "play", that we'll contend with it. We don't need it. It serves no usefull purpose.
That last line was supposed to say that it'll let those who like to play "think" we'll contend with it.

A law also exists, to allow the Repeater owner(s) to carry out legal options to keep those kinds of actions from continuing. It's been tried in court already and stands. I recently used it myself.
Test Transmissions, are supposed to be made into a Dummy Load. Short "on air" test transmissions can be made, but should be done when there is assurance that no on going communications, will be affected or

interrupted. To do it for "FUN", I think not.

73,

Lou

I have. You apparently have no clue as to the origin of the law and its intent. For all intents and purposes, that law is obsolete. Obviously one can tune into FM radio and other public broadcasts using a scanner and there is obviously no restriction on divulging etc.

Sam,

Sory to say, I am not aware of any modifications to the Sony Air-7
or Air-8 as you probably have. Even if you could get the radaio to
accept such frequencies the RF part of the radio was not designed for
that part of the spectrum.

False. Please know what you are talking about before posting such an
assurance.

The use (for profit or ...) or the act of divulging non-"broadcast"
communications has been illegal since (at least) the Comm. Act of 1934.

Also, dont forget that treaties take precedence over other laws. This
may also cover certain situations.

You have just discovered the fatal flaw in the PRO-43: horrendous
intermod in VHF-hi.

Triple conversion will keep images from showing up where they don't
belong; it does not guarantee freedom from intermod.

Using an antenna having less gain might help.

>What is the optimum charging time for the PRO-43, and for how long should the charge last?

I use 16-18h for standard cells, and 24+ hours for high capacity cells.
You should get 4-6h use.

>I am using a 9V 800mA regulated power supply to charge 6 standard Radio Shack
>Enercell NiCd batteries within the scanner, but only seem to get about 30mins
>use before the batteries go dead.

You are using a power supply capable of supplying THREE TIMES the current
of the recommended wall cube. It is possible that, when the batteries are
dead, the rush of initial charge current can fry the current-limiting
resistor in the PRO-43 charge circuit.

>The manual is not clear in this area, so any help would be appreciated.

Remove the cells and check them when the scanner goes dead. If all but one
still have voltage, then the odd cell may be dead. Try new cells.

..or spend $50 - $80 for a cheap shortwave receiver that will still work better than the mod. From what I've heard, the mod will require changes to the front end to give the unit a fighting chance at hearing signals out of the intended bandwidth, but I would hesitate making those changes to my Pro-43. I'll stick to my shortwave radio for SW and Pro-43 for scanning.

Andy

1015. Anyone have import problems?

Newsgroup: rec.radio.scanner
Date: 1995-01-23 14:16:07 UTC
From: steven@sgb.oau.org
Message-ID: <D2v3Mx.256@sgb.oau.org>
Source record: 262453

Now and then I receive inquiries about "since importing cellular receiving scanners is illegal, how do I know it won't get stopped at the boarder?"

Well, I always respond with:

Since there are procedures (which customs knows of) for importing ANY non-FCC certified device, they could care less if it receives cellular or not. If it is not FCC certified, it only needs to follow the non-certified device process and not be concerned with any other rules or requirements. The device can not be certified because of it's cellular capability, but the same process for a non-FCC certified device does NOT require it be even capable of being considered for certification. There are rules such as not for resale, personal use only, limit of three units per shipment, etc.

Now, the question is ... has anyone ever failed to receive their scanner due to customs/border problems? Did the scanner *never* arrive? Was it late or delayed? I can guarantee I will not publish your names, but I would like to take tally of the number of known cases of problems for when folks ask this.

Please be honest. I am NOT with the FCC. If I had my way, I'd have the FCC disbanded tomorrow! Anyone who knows me well knows what I think of the F***ing Communication Commission. All they did was reqiure that I import scanners - since I will not buy a US model with holes in the 800 mhz, or in Icom's case, totally eliminated! Remember, it was their funding bill which caused these problems, if they had received no funding, there would be no problem - hence why I think we should get rid of the FCC. Getting rid of them would solve future problems. Supposedly they stopped the cable problems with the cable prices... HA ha ha! Is that why it still continues to rise, with the main attraction being more pay per views, and NO sci-fi or cartoon network channels (two of the known most popular requested, even cablevision said that!). When they deregulated the phone industry (improvement? read on...), they opened the door to a charge for about every service the phone company used to provide for "free" in their one monthly fee. Ie, you want a service call, that will be $35 to start, oh, directory assistance? 40+ cents per call, long distance? Take your pick as the roulette wheel spins, wheeee! I get tired of the long distance service commercials! They are AT&T vs SPRINT vs MCI vs OTHERs!

As an aside, selling used equipment is legal. Therefore, it may be legal to import for personal use, three at a time, keep it a month and resell it as slightly used, with a regular order of three units every month. Selling three used scanners per month would not constitute a commercial business and the resale of used equipment is clearly legal. Atleast the buyer would not have to handle the international ordering (ie atlantic call) and would know the unit was tested, etc. It would also be a means to obtain them in the US, legally.

Perhaps someone can refresh my memory - what's the FCC's position on the resale of non-certified, personally owned equipment? Since HAM equipment falls in this category, I think "legal".

>and that other than that the bandplan was identical to the US .

There are other problems such as a 9Khz step size in the broadcast band and a default AM mode in the 154 - 156 Hhz range. There may be more, but these are the ones I have observed.

>RE the bounce. Are you refering to the fact that when you turn the dial to manualy change
>the chanel it will skip over a few chls and then stop on one. If so you are probably in scan
>and if you are in [scan mode] try hitting the [scan] button until you see M.RE in the upper
>Left corner of the vfo and then try tuning the chanel with the dial.
>
> If not and if i'm way off please inform me as to what is ment by the "bounce" problem please.

I know what you are talking about, and I have also observed this "normal" behavior. However, what I am talking about was quite severe. The problem was observed when manually moving through the channels, when putting the text label on a memory location, and when selecting parameters such as MODE.

Let me give an example. Lets say I was entering a memory label. The "M" would be selected, and I want to move to "N" - this should be one click clockwise of the DIAL. Well, sometimes it would work as you expect, but often it would jump ahead to, lets say "Q." Also, at leat 30% of the time it would jump backwards to "L" ! Quite frustrating!

It was refreshing to note that the new unit I exchanged my old AR8000 for did not have this problem.

RAlpert@qm.ATTAIN.com writes:
>Does anyone out there have an AR8000, the computer interface and a
Macintosh?
>

I have the interface and a Mac. I have written a HyperCard 2.2 stack to
run the AR8000.

The stack consists of several "Cards" that do the following:

Card 1 - Interactive command interface - enter a command and observe the
output. It also contructs an "MX" command from the individual parameters
to enter one-at-a-time memory locations.

Card 2 - Builds a "Search" command to enter search parameters. It also
has an interactive command interface.

Card 3 - Builds a "Scan Link" to link several scan banks and logs the
frequencies and number of
"Hits" for a scan. Great for unattended running to see if there is
activity on new frequencies.

Card 4 - Enables the entry of several frequency/label pairs for
populating a bank of frequencies.

Card 5 - General data management including:
- Browsing data banks (and printing & reporting)
- Saving and retrieving data banks to a file
- Clearing entire data banks
- Clearing selected memory locations in a sequential range in a
single bank

Card 6 - General notes

Card 7 - AR8000 command reference (thanks to Victor Healey!)

The stack does use some HyperCard 2.2 commands and therefore requires the
latest version of HyperCard(although I can generate an "application
version" - almost 1MB - that cannot be modified but does not require
HyperCard)

The stack is built around the Dartmouth serial drivers for HyperCard.

The program is more like a breadboard - it works, but it's not too pretty
to look at. If I can find the time, I will try to package it, and talk
Victor Healey into putting it on his www page.

I built the stack as a "labor of love" and would be willing to share it with anyone interested! Just give me a little time to get it in a form I can distribute.

I have both a PRO43 and an AR8000. I have used the add-on Radio Shack
scanning antenna with the center-loaded coil on both units. Using this
antenna, I have found the AR8000 to be superior to the 43 in the 45 - 50
MHz range. I don't think I have ever used the rubber duck that came with
the AR8000!

Source record: 262441

Being triple conversion just means that you probably won't be plagued by images. This has nothing to do with intermod, and the Pro43 is infamous for major intermod problems on VHF-Hi.

This has been corrected in the new Pro62 and supposedly in the upcoming high end Pro60 by them changing the IF freqs. This means that they just shifted the intermod elsewhere. I've used the Pro62 and it really is very good. Supposedly, Marymac has them for $195 delivered, thru the end of the month.

1025. Re: PRO-51 Perm. Hardware MOD'S?

Source record: 262444

There is evidently no "brown wire" in any Pro51s. Plus, the purpose of the brown wire is simply so that you can use the Test Mode trick and get 888.96MHz in your scanner. With your scanner, there's no problem.

The "brown wire" trick is possible in late model Pro46s. But, again, it is just for enabling the Test Mode freqs that include cellular. It still won't enable you to put cell freqs into a Limit Search.

1026. Re: Super-Bearcat 2500XLT or dealer scam?

Like they told you on CompuServe HamNet where you also asked, it is undoubtedly a scam. Better that you put your money into a better designed scanner, the new BC3000XLT.

1027. AR8000 search band programming

Newsgroup: rec.radio.scanner
Date: 1995-01-23 15:23:48 UTC
From: rb@mtsol.mt.att.com
Message-ID: <D2v6rp.DAL@nntpa.cb.att.com>
Source record: 262448

I've tried to program my AR8000 (thru RS-232) for search bands.

When I send the command:
SEB SL160.215 SU161.565 AU0 ST5.00 MD1 AT0 TTRailRds

I get an ERROR response. Sending the same command but without the AT0 argument results in no error. However, niether of the commands seems to take effect since both the lower and upper case search bands still contain the factory installed programs.

I know the computer interface and software are working ok since I can program memory channels using the MX command (without the AT0 argument).

Also, the RX command doesn't return anything.

What am I doing wrong? I'm not using passwords and I'm in newuser mode.

Thanks!!

>differences/advantages of the 2006?

I have a 760 and the 2005. Besides the fact that the 2006 has more channels and banks (mine has 6400 channels in 160 banks -mod), the 2006 has a much better RF section. It is sensitive, but does not overload easily like the 760. True, the 2006 does not have service search, but I don't see the point of scanning random services, not knowing who I'm listening to. The size of the 760 makes it a great mobile scanner, but if you drive around metro areas, you will get intermod on lots of channels (unless you use the CTCSS board).

Yup, it's still legal to do you OWN phone, but since the Cellular carriers
cannot distinguish between good guys and illegal cloners out to make a
buck, they have begun installing hardware to combat any type of cloning.
RF fingerprinting is now in use in some parts of the country, so the
cloned phone will be useless. Really not worth the effort. Too bad the
cellular carriers just wont allow you to have an "extension phone" like
the local BOCS do. You could have 2 phones, with 2 numbers, one forwards
to the other adn you only have one phone bill.

What's really strange is that in the USCS and USCA (United States Code Source, United States Code Annotated, respectively), there is mention of a court decision that stated that oral communications via radio carry no reasonable expectation of privacy, and are therefore not protected by this act (or something like that). Another case, however, stated that when the act was passed, its intent was to protect public service agencies from having their radio transmissions divulged by anyone, including the media.

Go to a law library and look up 47 USCA (or USCS) 605 and read all the annotations. It will make this whole issue even more confusing than it already is.

By the way, I am NOT a lawyer. Only a lawyer can give legal advice. I'm an electrical engineering major. I cannot give legal advice, and nothing in this message is to be construed as being anything other than the mindless babblings of someone who stumbled into a law library and read some books. If that's not enough of a disclaimer for you, then I would suggest that you disregard this message completely, because it has no meaning or weight in the "real world".

One more thing, whether it is illegal or not, I personally think it is pretty irresponsible to divulge information heard on a scanner. When the agency is ready for details of an incident to be released, they will release them. Until then, it is safe to assume that they don't want the non-scanner owning public to know about it.

After having my e-mails answered promptly from Andrej and hearing his explaination of what's going on (he sounds like alot of us "Midnight Engineers"), I think I'll reserve any further judgement on what he is able to produce written or otherwise, not on rumors.

Hi David,

The AOR case may with the plastic window may help.

Other than that.....(starts thinking out loud)....maybe some nail varnish
over the numbers may prevent wear..dunno ?

Last resort: Obtain a spare key pad (they are one moulded piece) and
replace it when things get too bad.

The MVT-7100 has a similar keypad - I can recall only one instant where
the numbering got so bad a replacement was needed.

In the case given as an example from Southern California, I don't beleive an NAL was issued. The FCC didn't seem to have a big beef with the operator. I heard it was the Sherriff that decided the radio was to be confiscated. I myself would not be one that would surrender any of my equipment unless the local L.E. official could show what authority he was using. A badge isn't enough authority to confiscate any property without due process.

It was unfortunate that the FCC didn't seem to see fit to step in and preempt the local authorities.

I've got a Pro 46 scanner for sale. It's a 100 channel scanner and CAN be easily modified to recieve cellular. I'll take $150.00 for it.

I've also got an HTX-202 2 meter ham radio for sale. It works perfectly, but looks well worn. It's got 16 memories, tone squelch, tone encode, DTMF memories (four, I think), etc, etc, etc. Great rig with an amazing reciever. I'll take $130 for it.

E-mail me if you are interested in either or both.

I thought of this idea about a year ago, and I called it Pirate Cell Radio. If you own the cell phone and pay for the air time, you could legally transmit anything for as long as you want - for godsakes it's your telephone! I never tried it, and I don't even own a cell phone, but my idea was to do this say every Friday from midnight to 2am. It would be nice if you could "grab" the same freq each time, like 876.000 or something clever like that. Anyway, I posted the idea to this group about 6 or 8 months ago, and I still don't know of a single station in any city doing this. I think it's a great idea. You could do commentary, play tapes, etc. I think you could even transmit a copyrighted show (rebroadcast a football game, for example) since it's your private phone, but I am not sure. I would not recommend re-transmitting any police radio channel, etc., although police who use cell phones often leave the police radio on in the background, don't they?

: 97.403 Safety of life and the protection of property.
[rest of Part 97 deleted]

If my memory serves me properly, there was an incident in North San Diego County a while back where an amateur used his (modified) radio to summon assistance by transmitting on the local police frequency in an emergency.

I seem to recall that while there was no FCC-related problem, the local sheriff's department did end up confiscating the radio under local ordinance. Regardless of what the law says, local government can and does pass RF-related laws, and does enforce them (scanner bans anyone?). Up until recently, the FCC hasn't cared about pre-empting local communications law. Perhaps this is changing under pressure from the cellular business and broadcasters...

(I also remember that the radio was eventually returned to the amatuer..)

Please respond to "AJENKINS@bss1.umd.edu" and cc to jwierzbicki@melpar.esys.com.

{minor snippery} I purchased a Pro-43 before Christmas and yesterday when I turned it on, all 200 of my channels that I had programmed were gone (Batteries were fine). When I tried to reprogram the frequencies I could only program the digits to the left on the decimal point. Everything I tried to enter after the decimal point was made '0'. e.i. I tried to program 453.5750 and the only thing that was accepted was 453.0000. Any suggestions on the problem? I also just found out that I was plugging my DC adaptor in the car into the charging jack instead of the power jack. I was told to do this by a RS employee. WHen I looked back over my owner's manual it said the complete opposite. Have I made a major mistake? Is this covered under the warranty? Thanks.

From: murple@clark.net
Message-ID: <3g0vhs$qpk@explorer.clark.net>
Source record: 262463

I recently purchased a Pro-46 scanner, one of the ones with the 5A4 sticker. I read the file on the keypad mod to get the 66-88 and upper 800 gaps restored, and tried it... it worked fine. Then I read some recent posts here about how it should not have worked due to this modem having an add-on device to disable it. I decided to open it up and see if it did indeed have this add-on. I opened it up, took off the top (radio) board... the board underneath had a large copper-colored shield soldered to it. I lifted it at two corners (the top/antenna end) by just pulling it up (the shield wasn't damaged). I saw that I did in fact have the add on device. I put it all back together, and didn't modify anything.

Later, I decided to see what other test modes there might be, so began turning the scanner on while holding down 2 + 9 plus other keys (manual, scan, lockout, prog, etc)... My stored frequencies were erased (no big loss I thought), and I didnt find anything interesting.

Then, I decided to give up and turned it on holding down 2+9+LockOut... nothing. The keypad mod no longer works! Ive lost the 66-88 and upper 800 blocked frequencies and can't get them back. The only hardware "modifications" made are that the shield is not soldered in 2 corners... Could one of the other keypad modes I tried (2+9+manual programmed frequencies in 1-20) have somehow activated the add-on device? Has anyone else had this problem? Short of disabling (what I believe to be) the add-on device, does anyone know how to re-enable the 2+9+L/Out mode?

Source record: 262472

Hello all. I am a newbie to this interesting hobby.

I just purchased a Realistic Pro-41 handheld scanner. It was the last remaining demo model and did not have a manual, box, or any other equipment included, so I got it for $50. It works great so far. The limitations seem to be that it only allows one bank of 10 channels, and apparently has no means of just randomly scanning a band (i.e. you have to enter a frequency to change frequencies, therefore you need to know the local freqs to begin listening).

Does anyone out there have one of these? Are there any modifications for the Pro-41 (I didn't see any listed at oak.oakland.edu)? Although it does not cover the aircraft bands or the 800 MHz band, it seems to be a pretty good deal for $50.

Thanks,

Brent Shaw

I've noticed that people that don't want phone calls, take the cordless phone
off the base, ignore the beeps and such, then the phone broadcasts anything
it picks up in the room back to the base, and around the neighborhood as well.

Perhaps this is one of the reasons Sheriff Jim Roach is now the ex-sheriff of
San Diego! It was sure one of the reasons why I didn't vote for him.

I have - there is no exemption from identifying that I can find for "short test transmissions". This type of transmission would be considered an authorized one way transmission but still needs to be identified. If you kerchunk in order to test your radio, that's fine - but you need to id IAW the rules under which you are licensed.

The only exemption from normal IDing procedures is for telecommand of model craft.

If I remember right, radio shack made the 2004 with cellular in the begenning
but then stopped because they sold cellular phones. They did not think it right
to sell cellular phones and scanners that could receive them at the same time.
So you may have an older model or it was modified before you bought it.

That is the best I can come up with.

: - mike
: (temporary e-mail address: newton@starbase1.caltech.edu)
: (never underestimate the destructive power of an ant)

I've been reading this thread for a while, waiting for someone to
write why it really is (probably; I'm no lawyer) legal for newspaper
reporters to use scanners.

The key is, as I understand it, that they do not publish what they
hear on the scanner as fact; instead, they use the scanner to unearth
interesting stories. They still have to go dig for the story, do the
interviews, background checks, etc. The scanner does not take the
place of the legwork. And therefore, by the time the story is written,
they really are not divulging "what they heard" on the scanner.

I doubt any reputable editor would allow a reporter to publish verbatim
something overheard on a scanner.

1065. PRO-43 freq mods (mini-FAQ)

Newsgroup: rec.radio.scanner
Date: 1995-01-24 02:39:09 UTC
From: gdallal@world.std.com
Message-ID: <D2w21A.1nG@world.std.com>
Source record: 262382

** ** Because there is a continuing demand for it, this mini-FAQ about frequency modifications for the PRO-43 will be posted occasionally until someone tells me to "get rid of it". ** **

Note: It is against the law (Electronics Communications Privacy Act of 1987, public law 99-508, amended 1994) to listen to cellular or cordless telephone communications. However, it is not illegal to own equipment capable of receiving such communications.

Which PRO-43 units can be modified?

Modifiable | Nonmodifiable
|
serial number no A in # | begins with A
FCC-ID AA020-300 | AA020-300A

There are no software modifications for the PRO-43. It is not possible to extend the frequency range of the radio by pushing buttons from the keypad. Such modifications are possible with other units, such as the PRO-51, but *not* with the PRO-43. The PRO-43, made by GRE (General Radio Electronics) of Japan, is one of Radio Shack's few triple conversion units. Radio Shack units with software modifictations are double conversion units made by Uniden.

Modification procedures for other radios are available by anonymous ftp from the pub/hamradio/mods/<manufacturer> subdirectories at oak.oakland.edu.

The PRO-43 modifications follow. There is some debate about whether step (5) is worthwhile. Many report poor reception; others report that the unit is not designed for good low band reception. So, if you trash the diode in step 4 or want to quit while your ahead, don't lose sleep over it.

Pro 43 frequency modfications

From: armille@afterlife.ncsc.mil (A. Ray Miller)
Newsgroups: alt.radio.scanner
Subject: TWO frequency mods for the PRO-43
Summary: cellular (870-890 MHz) and low band (51-88 MHz) restoration for PRO-43
Message-ID: <1992Aug20.045656.5971@afterlife.ncsc.mil>
Date: 20 Aug 92 04:56:56 GMT

A few people have mentioned the cellular mod for the PRO-43; it turns out you should not remove but MOVE the diode. Doing so allows cellular coverage as well as low band (up to 88 MHz) coverage.

Acknowledgments to Grove Enterprises; this information came from them. They are selling the PRO-43 for $300 which is $50 less than Radio Shack. I have no connection with them other than as a satisfied customer.

PRO-43
Cellular Frequency Restoration and Low Band Expansion

Note: It is not lawful to monitor cellular or conventional mobile telephone conversations.

The following procedure requires familiarity with microcircuit soldering and will violate your warranty. Grove Enterprises assumes no liability resulting from its attempt, nor will accept the modified scanner for return under any condition.

TOOLS NEEDED: Fine point, low power soldering pencil; solder wick or a desoldering tool; pointed awl, hemostats or pointed tweezers; small Philips screwdriver; solder.

1) Remove the battery, antenna and back cover (held in place by four screws).

2) Remove the six screws holding the top circuit board in place. Carefully unsolder the two antenna connections from the board. Bend the antenna ground tab fully up from the board. Carefully lift the board, unplugging the black connector at its base, and lay the board out of the way on its bundle of colored wires.

3) Remove the two screws from the next board and lift it, carefully unplugging the white connector at the bottom of the board. Lift it up and lay it aside on its brown wire (which can be unplugged if necessary).

4) Unsolder and remove the metal shield from the final board, revealing the microprocessor; note the row of diodes labeled D1-D5 above it. Only diodes D1, D2, and D4 are present; assisted by a pointed tool, unsolder and remove D4, the lone diode (this restores cellular frequencies which will be searched in 30 kHz steps).

5) Resolder the removed diode carefully into position D3 to extend low band coverage to 88 MHz.

6) Reassemble the boards, paying particular attention to the alignment of the plugs. Test the radio by entering any frequency between 870 and 890 MHz (cellular) and 51-88 MHz (low band).

This may be, but what you're probably hearing are room/baby monitors. They operate on (almost) the same frequencies and can be mistaken for what you've written.

: If so, post them here, don't just e-mail.
: --
: --
: Bob Cmar (bcmar@panix.com)
: In New York City's Colorful and Romantic Lower East Side

I've had the same questions myself a few weeks ago. I suggest that you
purchase "Police Call" and "Beyond Police Call" at radio shack. Police
call is packed with freq's on emergency city/county, State/Federal,
Highway Maintenance Paramedics, Forestry, Aircraft, Railroads. Since you
are looking for NYC freqs, make sure that you get Volume 1 1995 Edition,
which covers NY (NYC), Conecticut, Main, Massachusetts, New Hampshire,
Rhode Island and Vermont.

In anycase, here are some police frequencies that I find interesting:

(Manhattan Pcts 19/20/22/24) 476.3125
(Manhattan Pcts 6/10/13) 476.3375
(Manhattan Pcts 24/26/30) 476.3825
(Staten Island Pct 122,123) 476.3875
(Brooklyn Pcts 68/72/76/78) 476.4125
(Brooklyn Pcts 61/81/62) 476.4625
(Queens Pct 107) 476.4875
(Queens Pcts 104/108/112) 476.5375
(Manhattan Pcts 1/5/7/9) 476.5625
(Manhattan Pcts 14,17,18) 476.5875
(Manhattan Pcts 23/25/28/32) 476.6375

(Highway police/patrol) 450.8625

The above is just a sample of what you can get from
the books mentioned. I havn't purchased "Beyond
Police Call" yet; I will get it as soon as radio
shack has it availble. In the mean time, if you
or anyone else who has asked for NYC frequencies need
something specific, feel free to ask. Make
sure that you post here though, so that others could
share this information.

To everyone else who's helped me with my questions; specifically
Modifying my pro-43 to receive cell phone freq's, NYC freq's and others,

Thank you. I would not have known how much fun scanning could be without your help, suggestions and comments.

Now all I need is my "Beyond Police Call". In the mean time, if anyone has the freq's for the TV, Newspaper and radio Media in NYC, please post them here. I would love to pick up an unusual crime on a police freq's and then here the News crew at work to report it for the Evening News.

Rob

If a ham had the ability to summon appropriate aid via his modified
ht, and didn't, he would be, in MHO, a cad, and if I was the injured
party, I'd have words with him.

You example about other means is reducto ad absurdum. A simple look
around, or knowledge that he was out of repeater range (i.e. in the
wildernesss, or even rural areas) would suffice any rational test. Like
most hams, though, you've created a scenario that is bound to fail your
test. It's not a requirement to try every repeater pair, every simplex
freq, etc. It's a requirement (under the save life and limb rule) to
get help.

BTW, signalling at a plane is useless. In fact, it could even be illegal.

Thsi was my first scanner a couple of years ago. It is pretty basic and now
it stays in the car as my back up. It will scan only ten frequencies and no
priority just lock out for the ones you don't want right then. I have my
manual around somewhere send me an e-mail with your address or fax number
and I'll send a copy.

I use an AOR1000xlt with four 600mh AA batteries. I charge them for about 15 hours. Is this long enough?

Also, I have seen an 5 hour quick charger available so can I use it to charge these batteries even after theyve been used for several months in a normal charger.? After quick charging, can I go back to normal charging with same batteries if I need to?

Do I get same battery life?

Thanks Matthew

Here in College Station, the PD has been using "That's clear" and "received" for a few years. They don't dispatch with codes but close the call with Signal and Action codes as well. Sounds like like some kind of standardization going on. Same as Fort Worth changing what they call the fire trucks.

MTX9000's are Motorola trunked radios that only work in the 900mhz band.
They can be used as part of a trunked system or part of a conventional
system. There are three models: non-keypad, 6-button keypad, and full 12-
or 15-button keypad. If you're sure its a MTX9000 it is definately
operating in 900mhz.

It's not quite that simple, but 47 CFR 90.19(g)(3) reads, in part:

"A licensee may use, without special authorization from the Commission,
any mobile service frequency between 40 and 952 MHz, listed in subpart
B of this part of the rules, for communications in connection with
physical surveillance, stakeouts, raids, and other such activities.
Such use shall be on a secondary basis to operations of licensees
regularly authorized... maximum output power 2 watts... exempted
from station identification... use of Public Safety frequencies
not listed in paragrpah (d) of this section {Police Radio Service}
is conditional on the approval of the coordinator corresponding
to each frequency... Spread spectrum transmitters may be operated..."

When I wrote my review of the AOR8000, one of the complaints I had was band surfing with the AOR8000 in the SW bands. If the step is set to .05 for USB/LSB/CW, it gets pretty tedious turning that rotary knob around and around. Well, it seems that if you push the Function button while turning the rotary tuning knob, the tuning increment will increase by 10x. This does not appear to work with the up and down slewing buttons. I keep my unit set so that I don't have to keep the function key pressed when selecting the second key. So I just press Func and start turning the tuning. When finished, I press Func again to go back to the preset smaller step increment. Works great ! I guess that erases that complaint :] I did not see this in the manual, unless it was buried somewhere. If so, this is a documented feature that I over looked.

>and immediate protection of property when normal communication systems
>are not available.

Just wondering Les, if Part 97 is the rules for the Amateur Radio service,
how can they apply to any other service. Sorry, but they can't.

Although I agree that the radio was taken illegally, Part 97 is not the
instrument (the paragraph you cited) that allows a person to use any
means of communications in another service.

I am not familiar with the rules for any other service so don't know what
they may or may not say about emergency communications. California has a
serious problem with who can do what when and where in any part of the
radio spectrum for starters, including amateur. (I'm a native of California
and would not consider for a second to go back there to live.)

----------snip----------
I have lurked in this newsgroup for about 6 months waiting for someone to reference my scanner, the PRO-2011. I know this is old technology, but I would be interested in any mods available for it, especially those that involve holding down certain keys when you turn the scanner on.

And while I am at it:

I use a crystal controlled PRO-24 scanner at Winston Cup stock car races that I attend. Again I know this is old technology, but if anyone knows of mods for this scanner, I would be interested.

And Finally.....

Since I use the crystal controlled scanner at races, I need to get my hands on the frequencies the teams use as soon as possible. If someone out there has the frequencies for the 1995 season, I would really appreciate receiving them so I can get crystals ordered. Thanks!!!!!

1090. pro43 15-1000MHz mod!

Newsgroup: rec.radio.scanner
Date: 1995-01-24 14:18:47 UTC
From: dbaker@tiger.lsu.edu
Message-ID: <3g3287$1bt9@tiger1.ocs.lsu.edu>
Source record: 262400

Email Andrej at:
x91sensnovis@wmich.edu
for more information.

Hi all and thanks for the overwhelming response to our post of PRO-43 15MHz-1000MHz. This Mod was created about two years ago to recieve below 30MHz and 500-800MHz. The man who created this is writing this post with me now (Al N8KLI). We will try to answer as many questions as possible with this post.
This mod. is a combination of hardware and keypad entry used to evade the CPU's band edge program parameters. This mod only functions on "older" "cellular modifyable" radios. (If the newer ones do end up being modifyable it may work on them as well) This mod may be applied to other similar generation radios unfortunately not the PRO-34. The PRO-43 was chosen for this mod because you can choose your mode of reception i.e.AM or FM. This mod does not allow the user to program memory channels with out of band freqs. The only way to get to your intended target freq. is in search mode.
(No direct entry)
To help convince some of the doubters out there here are some particulars. Some questions have been raised about the radio's ability to even recieve these freqs. If you think about it, it already goes down to 30MHz and up to 1000MHz dropping down an additional 30MHz is not enough to upset the VCO, the first I.F. is at around 610MHz.
Lets try to simplify this, basically if you are recieving 30MHz the first local oscilator is at around 640MHz. If you are recieving 446 MHz the oscilator will be over 1000 MHz. See the pattern here? Going down to 590 KHz (a strong local AM station) is only a difference of about 5% in VCO frequency.
To improve low band reception we have removed (these are all part numbers and schematic location numbers) L101. We have added a bandpass circuit connecting the antenna terminal to L117 and C205. This was done to increase the sensitivity below 15MHz. We have also added a parallel (shunted) capacitor to C205 to mute local T.V. images.
Freq. steps are as follows:
500KHz-88MHz 5Kc
88MHz-137MHz 25Kc(in upward search)
5Kc (in downward search)
137MHz-225MHz 5Kc
225MHz-806MHz 12.5Kc
Above 806 per your radios diode configuration
The radio does have some birdies in the 600-700MHz range and will have a hard time hearing your local FM broadcast stations since there is no Wide FM mode on this radio.

We feel that shortwave is much more interesting than anything you may possibly overhear in the cell phone band. That was the original reason for this mod in the first place.
Some of you were asking about 400 channels in the words of the immortal you were asking about 400 channels in the words of the immortal seargent Schutlz "I know nothink!!!"
We should all ask ourselves why the heck didn't Radio Shack allow the full capabilities of the hardware to be used by the CPU in the first place!?!?!
Al N8KLI
Andrej KB8QGR
As for doing the mod for the general public we are small time and can't give any guarantees or warrantees other than our word that if you were to send us a working radio we would return to you a working radio. For this reason we are contemplating selling this mod to some shop with a "Name" to back up their work, or we'll just end up selling it to a magazine for whatever it's worth.

If this is sent to anyone other than dbaker@tiger.lsu.edu or dbaker.tiger1.ocs.lsu.edu please send it to him for me because an error somewhere in either my or his sys. is preventing him from reading the post from the 16th of this month. Thanks for your help
Andrej

I'm no legal expert, but I have always believed that as long as a public service's transmission
isn't scrambled, then it's legal to record & divuldge the informtion as long as it's not used
for illegal activities or personal gain (etc). As I understand it, it would be public property
and subject to the FOI act.

So, if Fred the volunteer fireman heard a call on a scanner, then called his brother Ed (who is also one) and told him of the call, That would be illegal? Hmmmm...

> Regardless of what the law says, local government can and does
>pass RF-related laws, and does enforce them (scanner bans anyone?). Up
>until recently, the FCC hasn't cared about pre-empting local communications
>law. Perhaps this is changing under pressure from the cellular business
>and broadcasters...

Actually, the FCC probably isn't really charged with going after the local laws. Their enforcement power is to enforce the federal law. They can't chase all the county and city councils which may pass inappropriate statutes.

The way the FCC's exclusive authority is typically enforced is:

1. Some local statute conflicts with FCC authority.

2. Some poor guy gets charged with violating that statute.

3. In court the accused (or his attorney) points out that the statute is null and void because it violates the federal law.

4. The court invalidates the local law.

You will notice that the poor guy who was accused has to bear the burden of fighting the local statute in court (possibly through the appeal process). That is a pain in the neck at best and probably costs him a lot of time and money. Everybody benefits, but the guy who fights this through the courts better be prepared to do it right. It will probably cost him much more than the cost of a confiscated radio so some people may just accept the initial local penalty rather than fight it.

It really shouldn't be that way. I wish local officials would be more reasonable. (In fact I wish all government officials would be more reasonable.) Unfortunately in too many cases some jerk thinks he can score political points by passing an illegal statute (or just doesn't know that it is illegal). The only real solution would be for voters to demand competence and fairness from their politicians. Unfortunately I don't see that happening anytime soon, too many people will vote for anyone who promises what they want regardless of the fairness thereof.

1096. PRO-43 w/400 CHANNELS HERES HOW!

PRO-43 ENHANCEMENT
MEMORY EXPANSION & "FADE-AWAY" LIGHT
Brett Bennett 4/12/94
bbb@kuhub.cc.ukans.edu
Copyright 1994 B&D Electronics All Rights Reserved

INTRODUCTION

The following document details two enhancement modifications that are possible on the Radio Shack PRO-43
scanning radio. The first modification doubles the factory standard memory capacity, allowing you to enjoy an additional
200 channels of memory, plus 10 more monitor memories. After completing the first modification, it is a fairly simple
matter to add a 7 to 10 second delay feature to the LCD back-light lamp circuit. I designed and performed these
modifications on my PRO-43 and they do work. As I understand it, there (has been/is being) presented in WORLD
SCANNER REPORT a similar memory expansion. I have not seen this modification and for all I know it is a better way of
doing it. What is presented is a 'clean-room' design of my own that to the best of my knowledge is the only one to also offer
a time-delay for the LCD back-light. Having said that, let me say:

I ASSUME NO RESPONSIBILITY FOR ANYTHING THAT MIGHT HAPPEN TO YOUR RADIO SHOULD YOU OR ANYONE ELSE ATTEMPT THESE MODIFICATIONS. WHILE REASONABLE CARE HAS GONE INTO THE PREPARATION OF THE FOLLOWING DOCUMENT, I CAN NOT GUARANTEE THAT THERE ARE NOT ERRORS.

The procedure described below is very complicated, and involves the soldering and desoldering of very tiny
components and the cutting of printed circuit board traces. While the procedure is not irreversible, it will leave permanent
scars inside your scanner. It should only be attempted by someone with moderate to advanced electronics experience. I
don't think it should be attempted by, to quote someone else, a "weekend technician." If as you read through this you feel
intimidated by the jargon and required procedures or if an electronic schematic looks like a strange piece of modern art to
you, then this might not be the 'mod' you are looking for. The following document will assume you have obtained the
materials listed below, especially the Service Manual, and you have studied the circuit in some detail. I will not describe in
great detail where every component is or where every solder point on the logic board should be placed. Having the Service

Manual, and having studied the drawings therein will allow you determine to where it is I refer.

REQUIREMENTS

1 - PRO-43 Service Manual. (Tandy Parts # MS-2000300 - approx. $6.00)
1 - CD4053 - Triple - SPDT analog switch - Surface mount package (DigiKey #CD4053BCM-ND - approx. $1.50)
2 - 93C67 EEPROMs (Tandy Parts # MX-8050 - approx. $13.00/each)
1 - 100k x 5 resistor network. Common lead type. (DigiKey # Q5104)
1 - UN2111 PNP transistor (Q1 on Logic PCB. Tandy Parts #)
1 - 1 uF 16v capacitor.
1 - 10 MOhm 1/8-1/16W resistor.
Misc.:
Wire wrap wire-30 gauge. (Radio Shack)
Grounded soldering iron with approx. 1/32" tip or smaller.
Desoldering Equipment.
Digital Volt Meter. (Used to double check your VCC and Ground connections, pre-check switching assembly)
Utility knife with fresh sharp small blade. (Needed to cut traces.)
Strong hand held magnifying lens. (Needed to check solder joints.)
+5-10 Volt bench power supply. (Used to check switching assembly.)
Anti-Static work place and grounding wrist band.
Very fine needle nose pliers, wire cutters.

THEORY

When studying the schematic for the PRO-43 one sees that the channel memory is organized using two 93C67
EEPROMS. As is common in microcomputer designs, the memory is all connected together on a common bus, with the
individual memory devices being selected with a Chip-Select (CS) control line. The 93C67 are particularly simple, in that
they are serial devices, only requiring 4 signal lines. (Data In, Data Out, Data Clock and CS) This inspired me to consider
the possibility of adding two more EEPROMs, creating in effect a second 'bank' of 200 channels. One could then,
presumably with the flip of a switch, choose between the original 200 channels, and a second bank of 200 channels. (In
theory, this could continue to 600, 800, 1000 etc. channels. In practice however, space is very tight in the PRO-43, and
getting anymore memory installed would be very tricky.)
Switching two CS lines between two pairs of EEPROMs requires the equivalent of a DPDT switch. While it might
be possible to do this with a mechanical switch, the physical implementation of this could prove to be very difficult. Rather
than use a DPDT switch, I chose to use a CD4053 triple 2 channel analog multiplexer/demultiplexer. This CMOS analog
'mux/demux' can be viewed as a triple SPDT switch. Two sections of the CD4053 are wired in such a way as to act as a
DPDT switch. The advantage being that a DPDT switch can be controlled with a SPST switch,

and no actively switching
digital signal lines need leave the area of the CPU. At this point one is still faced with the need of a mechanical switch to
control the CD4053, albeit, only a SPST switch is needed. It was suggested to me by someone on the Internet, that the
'Keylock' switch might be a good candidate. And indeed it is! While it might be nice, once in a while, to be able to disable
the keyboard, it is more than a fair trade to give this up for more memory. Thus I used the Keylock switch to control the
DPDT switch made from the CD4053.
Good design dictates that the state of all signal/control lines are always in a known state. The 93C67's CS lines are
active high leading to the need for pull-down resistors on all 4 CS lines. This insures that the 93C67's not currently being
used will have their CS lines pulled to ground. I accomplished this with 100K ohm resistors connected between the CS line
and ground. Physically I implemented this using a resistor array (SIP package) containing 5-100K resistors all having one
common lead. The 5th. resistor is used to pull-down the CD4053 control lines making up the DPDT switch. This is
necessary when the Keylock switch is in the open position (unlocked) since the line must be driven low.
This leaves a SPDT switch in the CD4053 not being used. Studying how the lamp circuit works shows that the
keyboard light switch grounds the base of Q1 to turn on the lamp. Using the CD4053 to act as the switch to ground, and
placing a large RC time constant circuit on the control line of the CD4053 will allow for a time delayed lamp modification.
Because the input impedance of the CD4053 is extremely high, a small valued capacitor and large value resistor will work.
In my design I used as 1 uF tantalum capacitor and a 10 MOhm resistor to form the RC time delay. The Pro-43's keyboard
light switch is connected across the capacitor to discharge it when depressed. This causes the CD4053 to switch on,
grounding the base of Q1. After the switch is released, the capacitor begins to charge through the 10 MOhm resistor.
When this voltage reaches approximately 1/2 VCC the CD4053 switches off, and the lamp goes out. (One caveat: When
the radio is first turned on, the capacitor is discharged and therefore a lamp timing cycle will begin with each power up.)

PROCEDURE

REMEMBER TO ALWAYS WORK AT A STATIC FREE WORK-STATION, INCLUDING THE USE OF GROUNDED SOLDERING EQUIPMENT AND THE WEARING OF STATIC REMOVAL BRACELETS.

The first step is to build the switching assembly. To build this first tin the leads of the surface mount CD4053 and
the resistor array. Following the connections shown in the schematic (figure 1), attach short (3/8" to 1/2") pieces of wire
wrap wire between the 5 resistor leads of RA1-NEW and pins 1,2,3,5, and 9-10 on the CD4053. (You should always: Size,

cut, strip, tin and trim the wire before soldering it to the CD4053. Doing this makes it fairly easy to get good solder
connections.) Connect the common lead of the resistor array to pins 6,7,8 and 12 of the CD4053. If done correctly you will
have the resistor array laying flat on its side with its leads facing the CD4053 as shown in figure 2. This makes the
assembly very thin. Inspect the solder joints with a magnifying glass, and give them a gentle 'tug' to make sure they are
securely soldered. The PCB board drawing on page 19 of the service manual is an actual size drawing. Check to see that
your assembly will fit into the area just above IC1 and to right of IC2.
Soldering to the pins of RA1-NEW, connect 4 - 2.5" lengths of wire to the resistor leads going to pins 1,2,3&5 of
CD4053 (This makes up the 4 switched lines going to the CS pins.) Connect a 5" length of wire to the resistor pin
connected to pins 9&10 of the CD4053.(This will go to the Keylock switch.) Attach a 2" piece of wire to the resistor lead
attached to pins 6,7,8 & 12 of the CD4053. (This will be the ground connection.) Attach 3 - 4.5" long wires to pins
4,15,&16 of the CD4053. These will be the two poles of the switch and the VCC connection respectively. Finally attach 2 -
5" wires to pins 11 & 14 of the CD4053 if you intend to also add the lamp timer modification. At this point you should
have a strange looking device with 11 wires sticking out of it. DOUBLE CHECK YOUR WORK AND SOLDER JOINTS
AT THIS POINT.
The next step is to check the operation of the switching assembly. Using a 5-10 volt power supply, apply power to
the assembly. Using a DVM, check to see that there is continuity between pins 4&5 and pins 15&2 while the control line
(the wire attached to pins 9&10) is not connected to anything. And also check to see there is NO continuity between pins
4&3 and 15&1. If that checks, attach the control line to VCC. There should then be continuity between pins 4&3, and
15&1 and no continuity between 4&5 and 15&2. Next check for continuity between pin 14 and ground when pin 11 is
grounded. The resistance between 14 and ground should become infinite when pin 11 is then connected to VCC. After
check-out put the assembly aside in a static proof container.
Using extreme care bend all the leads, EXCEPT FOR PIN 3, of one of the 93C67 so that they are pointing as
straight DOWN as possible . Bend pin 3 so it is sticking straight out from the body of the chip. These leads are very fragile
and I suspect they will only accept a single bending before breaking,. After the leads are bent, carefully tin all leads. Put
the EEPROM back in its carrier, and repeat on the second EEPROM. The next step is to prepare the scanner for the switch
assembly. From here on out, "The cheese becomes more binding," so work carefully and think about everything twice
before doing it!

Remove the battery compartment lid and battery. Remove the 4 case screws and the back of the case. Disconnect
the two wire connectors on the RF board. Desolder the antenna feed line and its ground connection. Remove the 6 screws
holding down the RF board and remove it from the audio board. Disconnect the speaker wire from the audio board, and
remove the 2 screws holding it to the front of the case. Separate this from the front of the case. Desolder and remove the
RF-shield from the logic board. Wash your hands to remove as much skin oil as possible! Remove the screws holding the
logic PCB. Turn the unit over, and with your hand supporting the PCB lower it from the case front. The reason for this is
that the LCD assembly will stay with the board. If during this process the LCD and its backing glass do separate, handle
them as little as possible. Also note the back-glass has a white frosted side. The frosted side, the light diffuser, is placed
away from the LCD panel. Remove the rubber keypad, and locate the two traces running to the Keylock switch. Using a
sharp utility knife, cut both of these traces near the switch, examine the cuts with a magnifying lens to make sure the switch
is severed from the rest of the board. Avoid touching the keypad contact area as much as possible. Checking to make sure
dust has not entered the LCD view area, put the logic PCB back in the front of the case and secure it with its screws.
Locate IC2 and IC3 EEPROMs on the logic board. Add to each of the pins on both chips a small amount of solder.
This will be necessary to attach the new EEPROMs. Of course you must make sure that you form no solder bridges. At this
stage I suggest you re-install the audio board and RF board. (There is no need to solder the RF shield back on, nor should
you resolder the antenna connections.) By holding the battery in place and slipping the battery lid into proper position, it is
possible to power up the radio without bothering with the case back. Check to see that all keys are functioning correctly
except for the Keylock switch, and that the display looks normal. You are now ready to begin the 'fitting' of your switch
assembly into the radio.
Locate the area just above IC1 and to the right (as being viewed from the backside of the radio) of IC2&3. There is
a relatively open space here where the CD4053 and resistor array can lay. Cut a piece of thin card board stock to be slightly
larger than the area taken up by the switch assembly. This will serve as an insulator between the logic PCB and the
assembly. Keeping the assembly in its final position, start sizing the lengths of the wires. The wires connected to pins 1&2
of the CD4053 must reach IC3 pin 3, and the wires on pins 3&5 of the CD4053 must reach IC2 pin 3. Remember when
cutting these down to leave enough extra wire for stripping, tinning and final trimming. The wire connected to pin 15 of
the CD4053 must be long enough to reach the TRACE on the PCB going to IC3 pin 3. Likewise

the wire on pin 4 of the
CD4053 must reach the trace running to IC2 pin 3. The switch control wire (pins 9&10 of the CD4053) must reach down
to outside most solder pad on the Keylock switch. VCC, pin 16 of the CD4053, is sized to reach the 82 ohm resistor R26
located next to Q1. The ground connection can be made on the large copper area under the switch assembly after scraping
a small area of solder-mask off. After the wire lengths have been determined, strip and tin the ends of all the wires and set
the assembly aside.
Using a sharp knife, cut the trace running from IC1 to pin 3 of IC2. Repeat this for the trace running from IC1 to
pin 3 of IC3. On either side of the cuts, scrape off a 1/8" area of solder mask and tin the exposed copper. Be careful not to
damage any of the surrounding traces or components. Place the switching assembly in its proper location and solder the
ground wire to the solder-mask free area you made near IC1. Attach VCC (pin 16 of the CD4053) to the top of R26.
Attach the pin 5 wire to the cut trace that runs to IC2-pin 3, and attach the pin 2 wire to the cut trace running to IC3-pin 3.
Next attach the wire on pin 4 of the CD4053 to the trace running to pin 18 (previously running to IC2-pin 3) of IC1.
Likewise connect the wire on pin 15 to the trace connected to pin 19 (previously running to IC3-pin 3) of IC1. If done
correctly you now have 4 wires running to the four 'new' connection points made by cutting the two CS line traces. Connect
the wire tied to pins 9&10 of the CD4053 to the outside (left side) conductor of the Keylock switch. Attach a new piece of
wire to the center conductor of the Keylock switch. Size and connect the other end of this wire to center lead of IC5. (IC5
is low battery detector for the CPU. The center lead of this is connected to 5 volts which is sufficient to switch the CD4053.
Later we will need to attach another connection to R26, and squeezing 3 wires to this single point would be tight so I used
the 5 volt bus for switching.)
Place the insulator under the assembly and tape a corner in place so it will not move. Cut another cardboard
insulator big enough to cover the switching assembly, and place this on top of the logic PCB. Bending the currently
disconnected wires (pins 1,3,11,&14) in such a way that they don't short to anything (or each other) , install the audio board
back in to the radio. Install the RF board and prepare to power up the radio. Making sure the Keylock switch is in the
UNLOCKED position, turn the radio on. It should begin to scan normally. (Believe me you will breathe a big sigh of relief
when it does!) Turn the radio off, move the Keylock switch to LOCKED position and turn the radio back on. You should
see it either scanning frequency 000.0000 or the frequency field will be blank, with the channel counter incrementing.
After a few seconds, the frequency number always blanked out and the am/fm indicators blinked randomly on my radio. If

you are unable to make the radio scan correctly, there is something wrong with the switch assembly or your connections.
The next step is to install the new memory. The leads on the new memory are not long enough to reach the leads
of the factory memory. Trying to solder bridge the gap is difficult accomplish without also bridging adjacent pins. The best
way I found to do this is to use tinned wire wrap wire. So the first step here is to tin about 6" of stripped wire wrap wire.
Remove one of the new 93C67s from its carrier and place it on top of IC2, making sure that the extended pin 3 is over pin 3
of IC2. Put a droplet of solder on the tip of your soldering iron. While holding down the memory with a finger, apply the
soldering iron to one of the corner pins of both ICs. The droplet should 'jump' over the gap between the pins and solder
them together. Check both sides of the EEPROM to insure that all pins are accurately aligned. For the remaining
straightened pins, proceed as follows:
While holding the tinned wire wrap wire against the lower and upper pins, apply a freshly cleaned soldering iron
tip to the gap area of the joint. The extra solder you earlier placed on the factory EEPROM will then be available to flow
along the wire and solder to the pin of the new EEPROM. CHECK the joint with a magnifying lens. After a visual
conformation of the joint, clip the wire close to the pin of the newly installed memory. If you like go back to the first pair
you soldered and lay the wire into the molten solder. Repeat for IC3.
Attach the wire connected to pin 3 of the CD4053 to pin 3 of IC2-NEW, and connect the pin 1 wire to pin 3 of
IC3-NEW. Install the cover insulator over the switch assembly and prepare for a power up. With the Keylock switch in the
Unlocked position power up the receiver. After insuring that the factory memory is still working correctly, power down,
switch to the Locked position and power up again while holding down the 0 key and the Clear key. You should now see the
radio scanning frequency 000.0000 for all 10 banks repeatedly. Press the PGM key to stop scanning and enter a valid
frequency value and press enter. Press PGM, then the DOWN-ARROW, then PGM again. The frequency you just
programmed should now be on the display. (At this point feel free to cheer! YOU have just added 200 more channels to
your PRO-43. The next step will be the icing on the cake!)
This next step requires you to lift the BASE of Q1 from the logic PCB. (I found this to be very difficult, in fact, I
ended up destroying Q1. Thus the extra Q1 in the parts list.) Desolder and lift the Base lead of Q1 from the logic PCB.
Solder together one lead of R2, the positive terminal of C1 and the wire from pin 11 of the CD4053. Also from this
junction, connect a wire to the solder pad on the logic PCB where Q1's base was connected. The area to the right of the
Keylock switch provides a space where these components can lay. Connect the base of Q1 to

the wire connected to pin 14
of the CD4053 switch assembly. The other end of R2 is connected by wire to the top of R26, this provides the charging
voltage for C1. The negative lead of C1 can be connected to the RF shield ground pad near the Keylock switch. (Check
that the RF shield will fit in place over C1. If it will not, place C1 so that its body is just below the bottom of the shield.
Insulate the R2-C1 combination with electrical tape. Tape the switch assembly's top insulator cardboard in place and install
and solder the RF-shield back onto the logic PCB. Prepare the radio for bench power up. Turn the radio on, the lamp should come on. After 7 to 10 seconds the lamp should go out. Check in a darkened
room to insure that the lamp completely extinguishes. Depress the light switch on the keyboard. The lamp should
immediately light, and stay lit for 7 to 10 seconds after it is released. Install all the remaining screws for the RF board,
solder the antenna lead and ground connections, and replace the case back.

USAGE
The light feature is self explanatory, and quickly finds itself useful in darken conditions. As noted earlier an
unfortunate side-effect of the lamp circuit design is that the lamp will illuminate for 7 to 10 seconds every time the scanner
is first turned on. (Maybe this is a feature to some.) Switching between active banks requires a little more thought. The
safest way of changing banks is to: Turn the scanner off, switch banks, and then turn the scanner back on. But sooner or
later you will switch banks while the scanner is on. When this happens you will see a curious event. The radio's CPU will
continue to scan from the previously selected banks, but the frequencies scanned will now be those from the on-line
EEPROM. This makes sense, since the CPU has no knowledge that its memory resources have been changed. Pressing the
Manual button, followed by the Scan button, will cause the CPU to reload the scan banks that were last saved in the
currently selected EEPROMs. Also any monitor frequencies that were stored are recalled. This allows you to set up two
different frequency configurations, one in each bank of EEPROM. To change between them on the fly, just flip the Keylock
switch, press the manual button, followed by the scan button. The only time I can foresee there being a problem is if some
how one were to flip the switch while the CPU was doing a write to EEPROMs. Keeping this in mind you should never
have any problems.
There are a couple of 'gotch-ya' that can happen when switching memory banks without cycling power. The PRO-
43 loads the list of all locked-out channels only when it is first powered up. (This makes sense if you think about it. While
I don't know for a fact, I assume that the Lock-out information for each channel is stored together with that channel's
frequency in the EEPROM. If the CPU didn't pre-load the list of locked out channels, it

would have to constantly re-read
each channel to determine its lock-out status.) The side-effect of this is that it can cause the radio to appear to be randomly
locking and unlocking channels when switching memory on the fly. The only realistic solutions appear to be to either cycle
power when you switch memory banks, or use Lock-outs very sparingly. The Priority channel assignment is also loaded
only when power is first applied. This can make the radio start checking the wrong frequency when memory is switched and
the priority feature is used. The best way around this problem seems to be to assign the same channel number to be the
priority channel in each memory bank.

CONCLUSION
Performing the described modification will provide the owner of an already excellent hand-held scanner, the
convenience of a total of 400 channel memories and 20 monitor locations, doubling the factory capacity for under $40.00.
It also provides a "fade away" LCD back-light with a 7 to 10 second delay. The bank switching nature of the design allows
for the user to program two unique 'personalities' into the scanner selecting between them with the Keylock switch. The
modification while complicated can be performed by any person with moderate to advanced electronics experience.

Jim,

Please read my posting. I don't think I made an interpetation of it, I
only quoted it. But now that you brought it up, It clearly states that
ANY means of communication is allowed in a life threating situation if
normal communications are available. (Since we're talking Amateur radio
here, I assume any form means, any form when normal Amateur frequencies
are unavailable.) Just a thought. I guess you can read it any way you
like, but if you really want to know e-mail the ARRL and ask for a
clarification.
Les

I have a Pro-43 and have great enhancement on UHF receive when I hook it to an external ant (especially the discone). However, the VHF is actually worse. Anybody have an answer for that? I know it is nothing freaky with my radio because a friend of mine also has a Pro-43 and it reacts the same way.

Thanks,

Ken

I've got two scanners and a two meter radio for sale.

The Pro 46 is a hand held scanner with 100 channels, 800 Mhz coverage and IS cellular restorable. Great shape - $150.

The Pro 2026 is a mobile scanner with 100 channels, 800 Mhz coverage and IS cellular restorable. Great shape - $160.

The HTX-202 is a two meter radio in great shape and has all the bells and whistles - CTCSS (subaudible) tone encode and tone squelch. DTMF tones and 5 DTMF memories, 16 frequency memories, etc, etc. MUCH better recieve than on my Yaseu 530! Asking $160.

E-mail me if you are interested in any of the above.

From: brett_miller@ccm.hf.intel.com
Message-ID: <brett_miller.95.00114EB2@ccm.hf.intel.com>
Source record: 262292

I am looking for suggestions on a good, cheap way to get a spectum display hooked to a R7000, AR3000A, or Pro-2005. I know Grove sells one, but at $500 for the unit, you don't get a real sweep display, just dots. I have seen some for about $1100 that look ok, but I'd like to keep this under $600 if possible. I do not have an O-scope, but I know there are kits to turn one into a spectum display. Anybody have experience with these type? Can used spectrum analyzers be purchased for less than $600?

Anybody have that Standard radio (AX700 as it used to be called) that has a band scope in it? Any good?

Any suggestions welcome.

I have just about any frequencies you would want for the Dayton, OH area. Can you give me an idea what specific types, or for what communities? What I particularly like to listen to is MVH Careflight, which is 462.975 and 467.975 (The control center broadcasts on the first freq, and the chopper answers on the latter). Then you can hear the chopper relaying medical information to hospitals on 155.28.

My recollection is that there were rumors of both types of PRO-43's (modifiable: no A in serial number or at end of FCC-ID; nonmodifiable: A in serial number and at end of FCC-ID) with a manufacture date of 4A4 (April, 1994). I'm trying to nail this information down for the frequency modification mini-FAQ.

I've gotten a firm report of a nonmodifiable type (A in serial number and at end of FCC-ID)? Has anyone seen a modifiable unit with a 4A4 date of manufacture?

Thanks.

1108. Improvements for Ramsey 800 MHz down convertor?

Newsgroup: rec.radio.scanner
Date: 1995-01-24 19:08:15 UTC
From: eskin@btree.brooktree.com
Message-ID: <3g3j6v$7p1@btree.brooktree.com>
Source record: 262413
Cross-posted to: rec.radio.scanner,alt.radio.scanner

To augment my AOR8000, I just built a Ramsey 800 MHz downconvertor kit.

Unfortunately, I'm not too pleased with it's performance and was wondering if anyone has come up with any mods to improve it.

It works OK, but only seems to pickup extremely strong signals. Other 800 MHz signals that are full quieting and audible even with the squelch turned all the way up on my other 800 MHz unlocked scanner (Pro-43) do not show up at all with the convertor.

I've gone through the circuit and I've built it correctly, all the test point voltages seem good... anybody have any ideas?

I'd appreciate any suggestions at this point...

Thanks,

Michael

I've always thought the codes and the differences between codes of even adjacent cities was deliberate, the purpose being to confound "casual" radio eavesdroppers. Of course, most people can figure out the codes after a while without any list of codes. It is only the most naive and infrequent scanner listener who does not understand. But where will the fun of monitoring the police be if they start talking like ordinary folk? 8-)

I bought one about 2 weeks ago from a Radio Shack in East Central Florida.
No A's in the serial no. or A's preceeding the FCC ID. A small square sticker
on the box marked 1A4 indicated that it was manufactured in Jan 94. They were
asking $289 and with a little bit of negotiation I was able to get the RS sales
guy to sell it to me for $260 with a free two pack of ni-cads. It was the last one
in the store.

1113. Modifiable PRO-43 4Sale. New and in box.

Message-ID: <3g3k83$fnq@newsbf02.news.aol.com>
Source record: 262416

I have eight PRO-43's remaining, new with manuals and in original boxes --
all manufactured in 1993 before the CPU block was implemented. All have
FCC ID numbers without the trailing A and all have production codes that
end in A3 (5A3, for example).
Yes, you might still find one in your area and you might even find
one on sale (Reg. $350 plus tax, sale usually $289 plus tax). In many
areas of the country the modifiable PRO-43's are no longer available. My
price is $325 plus COD charges. There are ways for you to verify who I am
and I can put you in touch with members of this newsgroup who have
purchased one of the scanners from me. Please email me if interested.

>

In my case, this "bounce" problem happens whenever I use the rotary dial
on the top of the radio.

For example, lets say I just punched in the frequency of the local
county sheriff and want to set the text label to "SHERIFF". Assuming
the current character is A and I want S, I turn the dial clockwise and
expect to get the following sequence:

A-B-C-D-E-F-G-H-I-J-K-L-M-N-O-P-Q-R-S

On my radio I get:

A-B-C-B-A-B-A-A-A-B-B-C-D-E-D-C-B-B-C-B-C-B-A-B-B-C-D-E-E-C

This makes entering text labels, selecting a memory channel, or tuning
the VFO with the dial nearly impossible.

And unlike yours, mine never gets better no matter how much I use the
dial.

There is but one small problem with that: fixed to FM only.
I found that by doubling the 10.7MHz IF frequency to get 21.4MHz and
adding it to the place where I found something that did not belong,
I got a frequency number which made sense.

Some of the images were VERY convincing though, and the 133 was definitely
stronger and clearer than the 155.

Message-ID: <3g3r75$g79@ccshst05.cs.uoguelph.ca>
Source record: 262295

I use the exact adapter that the manual calls for (I don't know the model off hand). I let it charge for usually 18 hours and find I can get about 7 or 8 hours from one charge. I think it is important to let the batteries run right down to nothing occasionally, and every once in a while I take the batteries out of the pack and re-arrange them but I don't know if that does anything helpful or not.
Does anyone know if the charging rate changes if you charge and run the scanner at the same time? It isn't clear in the manual if charge time is altered by running the scanner at the same time.

Dave

1123. BC200XLT mod botched...please HELP

Newsgroup: rec.radio.scanner
Date: 1995-01-24 21:50:02 UTC

Message-ID: <1995Jan24.215002.28311@gdstech.grumman.com>
Source record: 262316
Cross-posted to: rec.radio.scanner,alt.radio.scanner

[posted for a friend, please reply to jbuck@rama.poly.edu]

We attempted to perform the "cellular frequency" un-block modification to
the Uniden BC200XLT scanner. We did the one that requires soldering a
resistor to surface mount components. Supposedly, this modification was
performed by a "qualified" expert, and the surgery seemed to go OK.
Unfortunately, it seems to have destroyed the radio.

Here's what happens (after the modification):
The keypad seems to work fine, IE you can key in any frequency now.
The light does not work.
There is no sound.
The scanner will not stop on any frequencies (including WX).

After un-doing the modification, everything remains the same, except you can
not key in the blocked frequencies. That is, no light, no volume, no scanning.

The thing DID work correctly PRIOR to any modifications, so, something
happened. Could it be a loose connector? Fried component? Solder short?
Does anyone have any suggestions?

In other words, we now have a very expensive paper weight. Since I did not
perform the modification (I am smarter than that), I really do not know what
the guts look like.

Since we are not regular readers of this newsgroup, please reply by
E-mail to: jbuck@rama.poly.edu

Thanks

1124. New law prohibits what?

Newsgroup: rec.radio.scanner
Date: 1995-01-24 22:32:42 UTC
From: kim@nntp.cadence.com
Message-ID: <D2xLAJ.2KJ@Cadence.COM>
Source record: 262294

I read in some thread here that the new Federal law that now prohibits listening to cordless phone conversations also prohibits listening to auxiliary news traffic (such as traffic choppers, etc). Is this really true? If so, what is supposed to be the rationale? I thought the airwaves were free, and that there is no presumption of privacy on these channels.

I understand the reason for making listening to cellular and cordless phones illegal, although this attempt at a legal solution is stupid, fatuous, and misleading to the general public.

But to prohibit listening to public services (OK, semi-public); why? Certainly the news organizations know better than to trust to a legal solution for this!

I hope someone will tell me I'm all worked up for nothing. If not, how long before it becomes illegal to listen to police and fire dispatching?

When Ericson wrote that holding the side func button would affect
the operation of the vfo knob in a desirable manner it quickly
becomes clear that if any button is inadvertantly
pressed by an individual while using the ar8000's top knob
unexpected operation may occur. This may explain the behavior
unique to one individual but not duplicable by others.

>a while without any list of codes. It is only the most naive and infrequent
>scanner listener who does not understand. But where will the fun of
>monitoring the police be if they start talking like ordinary folk? 8-)

Actually, the 10-codes were originally generated for people who have the habit of not waiting a second after keying up to speak. Old, old radios that had to spin up a magneto could not transmit until their radio was literally spinning up. By saying "10-4", the dispatcher would get the "4" and understand that it meant 10-4....

Jeff Goldman (76703.4224@CompuServe.COM) wrote:
: There is evidently no "brown wire" in any Pro51s. Plus, the purpose of the
: brown wire is simply so that you can use the Test Mode trick and get
: 888.96MHz in your scanner. With your scanner, there's no problem.

There is a small board and a brown wire in the PRO-51 with
date code of 7A4s stuck on the CPU/DISPLAY board.

: The "brown wire" trick is possible in late model Pro46s. But, again, it is
: just for enabling the Test Mode freqs that include cellular. It still won't
: enable you to put cell freqs into a Limit Search.

Havn't tried the "Brown Wire" trick but I understand it can be done
via the power on keyboard trick.

No Limited search but you still can scan up and down in the cell range.
If you go out of the cell range then simply go back to ch 23 manualy
and scan agian. The freqs can be stored in the "Monitor" and "Regular:
channels via the temp. Monitor channels.

1135. AR8000

Newsgroup: rec.radio.scanner
Date: 1995-01-25 01:06:17 UTC
From: cremer@delphi.com
Message-ID: <9501242009591.DLITE.cremer@delphi.com>
Source record: 262302

I've recieved my AR8000 and the comp interface from Javiation and I like it a lot! But I spent one very frustrating evening trying to program a few banks by computer. Over and over again I went through the steps laid out in the interface manual but most, not all, of my channel asignments were rejected. I finally figured it out the next day, the machine didn't like my step assignments. 15 and 25 KHz are the correct intervals for the 155 and 470 MHz bands but the AR8000 won't accept them. Changing the step to 5KHz did the trick and all my channels were programed in no time flat. I wonder why the scanner rejects entries based on step sizes even when I've made sure to specify that the Automatic (Step & Mode) bandplan feature was off?

At any rate, this doo-hickey may be mighty complicated, but it sure is fun!

>I've been reading this thread for a while, waiting for someone to
>write why it really is (probably; I'm no lawyer) legal for newspaper
>reporters to use scanners.

My own interpretation of the law is (and I've not read any of the case annotations) is that it probably IS techinically illegal for teh newspaper to utilize even indirectly what they learn via a scanner. They do 'profit" from it in that they can gain inofrmation that they use in teh course of their business. It seems to me that somewhere in teh country towtruck operators got in some difficulty in listening in and racing to the scene of accidents in teh hope of scooping a job.

The reason they (newspapers) don't get hassled is that the local PD wants (no, NEEDS) the good press and friendly cooperation of the newspaper and radio/tv station(s). Can you imagine the screams of cnesorship that would be raise dif the media were held to the letter of teh law? The legal niceities of the Communications Act of 1934 would be netirely lost in the venting of selfrighteous outrage. Not worth the trouble. A better solution is a secret frequency or (more recently) cell phones. Some will also note that in some areas with new trunked systems the PD provides the media with handheld units programmed with the frequencies. Want to bet that ALL of them are there? This keeps the media happy and off the side of the scanner hobbyists who might complain ... this way the media is "part of the team" and the public is on the outside.

: To augment my AOR8000, I just built a Ramsey 800 MHz downconvertor kit.

You should have ordered your AOR8000 from either Javiation or Atlantic :(
as it would probably have saved you money and gained in performance. It's
a shame - I suspect the extra duties and shipping would have been the same
as the cost of the converter.

: Unfortunately, I'm not too pleased with it's performance and was
: wondering if anyone has come up with any mods to improve it.

New question: Has anyone (cloning or other) been able to determine the
exact difference between the US and INTERNATIONAL versions of this scanner?
I don't mean the bandplan, I mean the cellular -- where did they change it?

: It works OK, but only seems to pickup extremely strong signals. Other
: 800 MHz signals that are full quieting and audible even with the squelch
: turned all the way up on my other 800 MHz unlocked scanner (Pro-43) do
: not show up at all with the convertor.

Since you bought the converter for the cellular, it will probably do ok
for listening to folks you *see* using their phones in the car, etc.

: I've gone through the circuit and I've built it correctly, all the test
: point voltages seem good... anybody have any ideas?

May want to call Ramsey, they're normally pretty good.

: Does it sound like the control channels?

: if someone has the answers to these questions, please respond!

No, but it would be nice if you could mod an analog phone to TRANSMIT on the same frequencies as their digital! Since in analog, a signal with interference can often be still understood, if you hit the digital transmissions with interference, it will kill the signal enough to prevent the signal from ever reaching desired party. Result is worse performance, as phone will appear to not work at all.

Personally I prefer a poor signal over no signal. Anyone made a device to create interference on 800 mhz frequencies yet? I'd think it be fun to play on the frequencies used to control the Motorola Smartnet systems, especially after they spent so much money on them!

I don't argue the law with teenagers. You're sounding like one.

The Act is very clear and explicit. There is no room for interpretation
or semantic dodging. And it is not "obsolete", for it is still in effect as
the main body of law that governs communications and gives the Federal
government its authority to regulate same.

Of that I have no doubt. As my Criminal Justice professor pointed out,
the courts make all of the laws anyway.

> One more thing, whether it is illegal or not, I personally think it is
> pretty irresponsible to divulge information heard on a scanner. When

On this score we agree completely.

> agency is ready for details of an incident to be released, they will
> release them. Until then, it is safe to assume that they don't want
> the non-scanner owning public to know about it.

The only difference between us and the "non-scanner owning public" is the
simple fact that we happen to own scanners. Public safety agencies (police in
particular) don't differentiate. If they don't want the public to know, they
don't want ANY of the public to know - whether they have scanners or not.

From: scan911@aol.com
Message-ID: <3g4m1a$me3@newsbf02.news.aol.com>
Source record: 262307

Without quoting a zillion (or dozen) times....

I have been a newspaper editor for 20 years. Every newspaper from weeklies to metro dailies uses scanners.

But, as an editor, I would never let a reporter use in a story any information gathered from scanner listening. Every reporter is required to confirm information overheard. The rule is that if you can't confirm it, you can't print it.

And ... what's the difference between the newsroom employees listening to a scanner and someone calling the paper from home to report something? Nothing. I frequently call into my newsdesk from home at night when I overhear something "hot."

And, as a journalist, I have never known a newspaper to get in trouble from scanner monitoring. In fact, I know of some news organizations that have been asked to withhold information that they overheard because of the sensitive nature of the situation, and it has been honored in almost every case I have heard of. There was a very visible case involving the media and the FBI in the New York City area a few years ago.

And before every one goes quoting from Police Call or other scanner guides, go plunk down a few bucks at your local Government Printing Office store, or visit a depository library, and READ the Communications Act of 1934. Once you have done that, then you will understand the law.

In an emergency especially Life Threatening, you are permitted to use any forms of Communications at your disposal.

Part 97, only applies to the Amateur radio Service. There are other Parts, to cover other Services.

Only in one instance, can you be made to stay off the air.... in the middle of a National Disaster, the FCC can impose a Quiet Time. It can be done on a local or State wide basis, by order of the FCC Engineer in charge of that particular district, if the situation warranted it. Only certain communications would then be allowed.

Hope this helped.....

1160. New Mod & more for the BC-200 (& bc-100, pro-35 probably)

Newsgroup: rec.radio.scanner
Date: 1995-01-25 12:21:46 UTC
From: newton@gumby.gg.caltech.edu
Message-ID: <newton-2501950421460001@fig-ppp.caltech.edu>
Source record: 262321

After several months of near-continuous, overlapping, destructive disasters ("expositions, invasions, ..."), I finally had a day to myself and spent a few hours trying something I noticed in the BC-200 service manual ... and believe I have found a new mod. A search of a couple of the standard FTP sites did not turn up any previous description.

Also enclosed are a few other useful pieces of info including a minor new keypad hack. This is a VERY brief summary of these. There'll be more details in a week or so (the long form has lots of useful tables, tidbits, errors, ... and is already 10 pages). (And is better written than this.)

Note: I dont suggest doing this mod yet unless you feel adventurous ... there may be something better coming soon.

If you own a BC-200 (or possibly the BC-100, or ? pro-35) and want to experiment please send me e-mail (temporary address below). There may be a hack that will allow several new functions, but it involves de-soldering the UC-1147 pins. I can solder SMD components such as resistors, but not finely spaced CPU leads (I'm a software type).

Anyway...:

New keyboard "hack" : 2-9-L/O on powerup. This clears all freq.s but does NOT lock them out. Be warned: this hack leaves scanner in an "interesting" state. The first time that you hit enter (for a valid freq.) your scanner will appear to hang for ~~ 30 sec.s while that freq. gets entered into every channel. Maybe (??) this is the first part of one of Uniden's two-power-on cycle hacks.

New mod: run 2 wires from pin's 64 and 11 to a SPST momentary contact pushbutton switch. Pressing the switch alternates between "hypo"-scan and normal scan (similarly for searching). This might be useful for people who've changed the clock freq from 400kHz to 1000kHz (as i plan to do, if my xtal ever arrives). Note it would probably be easiest to solder at the pass through holes to the keypad. This mod simply fills in the "empty" space on the keyboard matrix (the matrix does not correspond to the actual key layout).

Reason I believe that there may be even better hacks: If you look at the signal types of pings 8-11 (row 1-4), these are the only pull-downed MOS. Also 52-64, 1-7 & 12 are the only non-pull-down MOS, and 64-5 are the standard columns. Thus, pins 6 and 7 seem VERY ripe for extra columns due to their external tie-up, the signal names (see p. 12) and location. I suspect there may be 8 new functions.... maybe

even some kind of search store. But two of these are probably just band selects for bands that aren't implemented -- see pins 55 and 57. Because of the routing of the signals, though, the only way I can see of trying this is by de-soldering at least 3 of the CPU's signals.

If you are going to this, please send me e-mail for info on the solder traces, etc. If you want, include your phone number. I'm also waiting on some technical manuals that may give more useful info.

Warning: Be very careful of the BC-200 service manual that you can order from Uniden. I've found roughly a page full of errors (some of these may be due to the revision level of my BC-200 (1991?)). But, some of the changes are major -- mixed up parts ...

More later,
- mike

ps: temporary e-mail address: newton@starbase1.caltech.edu

ps: anyone want to trade their AOR-800 for a BC-200? (no, i dont expect any takers.... but can always dream!).

Police Call is the best in books for public services in your area, Beyond
Police Call is pretty good for most other non-government freqs.

The CD-Rom to purchase is Spectrum by Percon. The Entire FCC database for
the U.S. for only $30. The search capabilities are limited but for $30
it's a steal!

>:::::::::AdaMatt@aol.com:::::::::
>^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Well, your kinda right. It does detect frequencies in the air, but you
must be in the antenna's near field. The near field varies, depending on
antenna gain, transmitter power etc. I've found for cordless you must be
within 6 inches of the handset. Several other 5 watt VHF H.T.'s I've
tried seemed to be readable from 60 feet or so. Cellular is another one
you must be very close to. Of course this also depends on what antenna
you use on the Frequency Counter. The telescopic whip that you can order
is ok, but there are several antenna's available for the different bands.

Opto-Electronics and Star-Tek are two makers of counters and Radio Shack
has one. R.S.'s is $99 and the rest start around $125. Pick up any of the
radio hobby magazines for a look at the Star-Tek and Opto's, and for
their numbers.

Hobby magazines such as Monitoring Times or Popular Communications which
are avaiable from most of the larger bookstores.

Good Luck....Les

Are there any mods for the Pro 2030. Mine is about one year old; bought in early 1994. How about those keypad/power-up mods I hear about? Is there someplace I can purchase specific instructions, etc. I'm a newbie, so be gentle with me, I don't think I'm brave enough to open up my "toy" and possibly destroy it with complicated intricate mods.

Thanks for any info.

A LOW COST PANADAPTOR
FOR THE R-7000

Copyright 1987, 1995, Bob Parnass, AJ9S

A panadaptor, or spectrum display, is a device which portrays visually the signals in a part of the radio spectrum. Panadaptors allow radio listeners to "see" activity on a portion of band without requiring the listener to tune the receiver.

They are useful for detecting the presence of spread spectrum signals or "hidden" signals riding on a sub-carrier of a main channel. Panadaptors are invaluable for detecting spurious emissions from transmitters, and unwanted products caused when 2 or more signals mix.

Panadaptors most often employ a cathode ray tube (CRT) for the display, and must be connected to the inter-mediate frequency (IF) amplifier stage of a receiver, at a point before filtering takes place.

The ICOM R-7000 2-2000 MHz receiver rear panel has a phono jack for wide band 10.7 MHz IF output. A DC vol-tage is also present at this connector and is used to power an ICOM TV accessory.

I've seen mention of 3 panadaptors for the R7000:

1. John Biro's article on retuning a Yaesu YO901 Multiscope panadaptor for 10.7 MHz, restricted bandwidth use. Selectable bandwidths of 20, 100, or 200 KHz are available.

2. The Sherwood Communications SCA-7000 signal moni-tor, priced at $1600, and reviewed in May 1987 "Monitoring Times".1 Bandwidth adjustable from 1 KHz - 1 MHz.

3. The Spectra-Display, priced at $350, which requires use of an external scope.2 Bandwidth

adjustable from 200 KHz - 10 MHz. Optional preamplifier required for 12 MHz wide sweep.

In the past month, several Kenwood SM-220 monitor scope/panadaptors have appeared at hamfests selling in the $200 to $250 range. The Kenwood SM-220 can display transmitted or received signals. To add spectral display capability to the SM-220, one must purchase the optional BS-5 or BS-8 module, which consist of a printed circuit board, a steel enclosure, interconnecting cables, and a new graticule. The panadaptor module mounts inside the SM-220 cabinet.

The BS-5 is used with the TS520 and TS530 transceivers, which have an IF of 3.395 MHz. The BS-8 is used with the TS820 and TS830 transceivers, which have an IF of 8.830 MHz. Since the IF of the ICOM R7000 is 10.7 MHz, one must alter the panadaptor circuitry to accept 10.7 MHz input.

If you have any choice in the matter, get the BS-8, as it requires fewer changes than the BS-5, and may even require no changes at all!

The panadaptor module circuit consists of several stages, but only two are directly related to the IF frequency:

1. A crystal oscillator is used as a marker generator.

2. A voltage tuned oscillator is swept across the IF of the receiver, and employs a varicap diode, an inductor and capacitors.

The marker generator is not vital for panadaptor operation. It merely provides a single "pip" that one may use to center the display on the CRT screen, and is similar in purpose to the crystal calibrator in older receivers.

The marker generator circuits in the BS-5 and BS-8 are identical except for one crystal. One need only replace the 3.395 MHz crystal (in the BS-5), or 8.830 MHz crystal (in the BS-8) with a 10.7 MHz crystal to adapt the SM-220 marker to 10.7 MHz IF. I did not alter this stage, although I would if I had a 10.7 MHz crystal handy.

The voltage tuned oscillator is the stage that deserves our attention. The changes required depend on whether you have the BS-5 or BS-8 panadaptor module.

Changes for BS-5 Module

Change the following capacitors:

1. C231 from 1000 pf to 68 pf.

2. C232 from .01 uf to 1000 pf. (You can use the capacitor which used to be C231.)

3. C234 from 100 pf to 22 pf.

4. C236 from 47 pf to 22 pf.

5. C237 from 680 pf to 100 pf. (You can use the capacitor which used to be C234.)

Solder a 10 microhenry inductor in parallel with L204, a 20 microhenry inductor.

Changes for BS-8 Module

I haven't tried the BS-8 module, but encourage you to try using it as is, without modification unless necessary.

These steps are needed only if you cannot find settings of the side mounted aligment controls that get the display to behave as specified in the owner's manual:

1. Remove C233, the 33 pf disc capacitor, from the printed circuit board.

2. Replace coil L204, the 4.7 microhenry inductor, with a 6 or 7 microhenry inductor.

Alignment

Follow the alignment procedure in the SM-220 owner's manual to adjust the panadaptor. This consists of adjusting 2 potentiometers and 1 trimmer capacitor through holes thoughtfully provided in the side of the cabinet.

The alignment instructions rely on the use of the internal Marker Generator to generate a signal at the center of the passband. If you haven't converted the Marker Generator circuit, you can tune your receiver to a frequency with a signal present at a known frequency (like 162.550 MHz - the National Weather Service), and use that as a frequency standard.

Most of the time spent in aligment will be in alternate adjustments between the trimmer capacitor and the wide band sweep potentiometer, which interact with each other.

Wider Bandwidth

The SCAN WIDTH switch on the stock SM-220 can be set to display a 40 KHz or a 200 KHz wide picture. I adjusted my modified SM-220 to display a 100 KHz or a 500 KHz wide picture. By adjusting the controls on the side of the SM-220, wider bandwidths are possible, but wider bandwidths make it more difficult to resolve individual signals close to each other in frequency. As the bandwidth gets wider, the horizontal sweep loses linearity, causing the graticule calibration lines to be inaccurate.

Connection to R-7000

As mentioned earlier, a DC voltage is present at the R-7000 IF output connector and is used to power an ICOM TV accessory. A direct connection between the R-7000 IF output connector and SM-220 would damage at least one of these units.

To block the DC voltage, a 0.1 microfarad capacitor was soldered inside the R-7000, between the IF output jack and the adjacent jack labeled "spare". Connection between the R-7000 and SM-220 is then made using a short length of RG-58/U coaxial cable, with one end plugged into the R-7000 "spare" jack, and the other end plugged into the rear of the SM-220.

This leaves the original IF output jack undisturbed so it can be used with the TV adaptor accessory.

Vertical Sensitivity

When I connected my modified SM-220 to my R7000, the SM-220 would display only the strongest of signals. To improve the display sensitivity, I inserted a 20 dB gain RF amplifier between the R7000 and SM-220. The amplifier was a spare Ameco PLF2 FET receiver preamp, adjusted for 10.7 MHz, but other amplifiers can be used, provided they have at least a 500 KHz bandwidth, and sufficient gain, at 10.7 MHz.

False Readings - Images

The SM-220 circuit is like a superheterodyne receiver. The panadaptor itself has a 455 KHz IF, and like other superheterodyne receivers with a low IF frequency, is prone to images.

An image is manifested as a false pip, which moves across the screen as the receiver is tuned, and is 910 KHz (twice the IF) away from the actual signal.

The images discussed here are in the SM-220, not in the receiver. Images are bothersome on the strongest sig-

nals, like those 300 watt paging transmitters that saturate the county with RF, belching out out strange digital noises or voices (now illegal to monitor).

Use With Other Receivers

The modified SM-220 can be used with other receivers having a 10.7 MHz IF. In other receivers, one would need to find the proper point in the IF stage (before filtering takes place), install a connector, then wire a DC blocking capacitor between the IF stage and connector.

I tried it before and works pretty good. You can turn it up as loud as your car radio amp allows you to. The device mentioned about is Radio Shack Part # 12-1951. I have a SONY version. Note: depands on your stereo to mono adapter audio may come out only on one side of your stereo speakers.

Why use a discone for scanner reception? If I understand it correctly, it has no gain, and without the added whip as described above, not much usefulness in the lower freqs. I also understand that discone's appeal has as much to do with its transmitting usefulness as its ability to receive. Sometime ago, I bought and installed Rat Shack's cheapo discone in my attic because it was expedient. It works reasonably well: I've got good elevation, short cable run and so on. When I decided to get something better, I called Grove and talked to one of their technicians. I told him that I was in the market for a new antenna and thought their $60-ish discone would be a good buy. He suggested that I instead try their Scantenna, which sells for about $40. He also said that I would get better results with that. I installed that in my attic as well. In side-by-side comaprison, the Scantenna is far superior to the discone. Yes, there is a price difference (as well as other issues) but you can't beat the Scantenna. I would advise asking around a bit more before going with a discone... BTW, I also have had good results with a TV antenna turned sideways--as good as with the discone in fact.

Nice example Dan. Actually no one has mentioned that - in some states it is
illegal to have a scanner in a business. What's a newspaper? A business!
So, to avoid the hole of a clearly illegal scanner in the business, (shall we
call it physical evidence?), they solicit from others from their homes (nice
concept!) since there is no physical evidence. I'll bet this same place has
outlawed portable scanners in vehicles too! I know Florida has a law against
scanners in businesses, but it's never stopped the portable in my briefcase. I
look at it this way - I do not own the business, and the scanner is my personal
property, therefore it's not used to benefit the business - hence not covered
under the Florida law relating to businesses. Same scanner sits on the
passenger seat when I am out. Its portable. It also meets the holes in that
d*mn law too. Now this may be different in other states, and that may be why
the comment. When you call a tip in, they do not know (or need to know) where
it came from, and if my suspicion is correct, they will not ask about that
either. This is a place where there is no physical evidence. Hence, while
the law could take a search warrant down to the press room and find a live
scanner as a violation, they could not do so for a "third party divulging"
if its not known how the tip was obtained.

>think that the owner of a cellsite is going to let you tie up that
>cellsite playing music or somthing?

It could be done. I doubt the owner of the cellsite would care as long as he is getting his money. There are many disadvantages. 1. Only those who can pick up that ONE cell tower could monitor. 2. Fidelity would be marginal. 3. It is very likely that the frequency would hop around every once in a while since the cell system tries to balance the traffic load. This is true even if you are not moving (although this doesn't happen much in rural areas). 4. Technically it would be illegal for anyone to listen.

Jonathan,

I used the FTPMAIL service in the last few days. It worked okay.
Received my file dated 95 01 23. Maybe you are experiencing a delay in
return from the operator, or something. Just an observation, but on the
subject line, the complete address should end with .us not .u as you pro
know,. I mention it in case you had it recorded incorrect.

Regards... Wally

1173. Computer control and ECPA

Newsgroup: rec.radio.scanner
Date: 1995-01-25 15:04:35 UTC
From: Harold G Peach Jr <hpeach@pop.uky.edu>
Message-ID: <3g5pa3$8d5@service1.uky.edu>
Source record: 262334

Let me start by saying that I do not monitor cellular. However, I would like to have a truly computer-controlled scanner. (I am using the COMMTRONICS HB-232 now, but it is still limited to what the scanner's microprocessor will allow.)

How difficult would it be to purchase a scanner, gut it, use the receiver and PLL, but replace the microprocessor with a PC? By placing the "smarts" in the PC, you could make it scan whatever range you wanted (within the limits of the receiver) and use whatever STEPS you wished. The possibilities are endless!

Any thoughts?

Harold

Another option is a FM transmitter. Radio Shaft has a new, stereo, small, portable, battery powered FM transmitter that will transmit on one of 4 user selectable channels. It has a stereo input plug and an antenna wire connected to it. Works for me. Sorry I don't have the cat # with me.

|> Can someone please suggest a good scanner mag mount antenna for cars?

Try the Grove ANT 4. $49.95. 24" fiberglass, 30-50, 88-108, 118-174, 225-400, 406-512, 806-960 mhz, and 12 feet of coax plus Mot & BNC connectors.

It's decent, and the magnet holds well. You can get the ANT 4W which is the antenna without the magnet, for $14.95. I had one mounted on the AM/FM antenna knob on the cowl for a while.

|> I think I remember someone mentioning a cellular-look-alike that worked
|> good.

Don't fall for the ANT 13. Grove will insist that its range is 30-1200 mhz, but anything below 137mhz falls into the great chasm. High band is 'ok', and UHF is acceptable. A 9-foot piece of speaker wire inside the cab works better.

Hold down 2,9 & BAND or 2,9 & MONI. You'll see all the display indicators light up repeatedly. At any time, just hold down 2,9 & L/O all at once. Within about half a second, you'll be in the Test Mode that has 888.96MHz in Channel 23.

I'm VERY new to this newsgroup and can honestly say I haven't the slightest idea what any of you are talking about... :-)

I've lived in the Santa Cruz Mountains for 10+ years now and have often thought about getting a scanner. These past set of storms totally convinced me that it would be a very cool tool to have. If the general radio reports on 1/10/95 were not so inconsistent, I could have slept in instead of getting dressed and driving over the Summit, just to be turned back... Anyway, I don't know *anything* about scanners. Where does one purchase one? What's the going price? What's the best model? What are the best (and worst) features to have? I live at the top of a canyon - would I need an antenna mounted on the roof? I know I'm asking someone to take time out from their busy schedule to help me out with this, but I would *really* appreciate the information and help...

Anyone willing? :-)

Thanks in advance.

Jill

1185. TR 980

Newsgroup: rec.radio.scanner
Date: 1995-01-25 17:17:35 UTC
From: Michael Cole <mbcole@clark.net>
Message-ID: <3g613f$ieg@clarknet.clark.net>
Source record: 262351

I have had a Trident TR-980 scanner for about 4 months now.
This is the first scanner that I have ever owned, so I am not
all that familiar with their characteristics. When plugged into the
wall, it seems to work well enough, but when I try to use it with
rechargeable batteries, the power only lasts for about 10 minutes,
then the unit goes dead. I have tried several brands of batteries
and I know the charger works from trying the batteries in different
appliances. Alkaline batteries seem to provide power for about 4-5
hours, depending mostly on volume. Has anyone else out there has these
problems, know a solution, or just want to share some info on this
particular scanner?

Thanks,
Michael Cole.

1186. Bearcat 55XLT mods

1189. AR8000 and hissing headphones

Newsgroup: rec.radio.scanner
Date: 1995-01-25 17:57:50 UTC
From: march@tudor.com
Message-ID: <MARCH.95Jan25125751@bonehead.tudor.com>
Source record: 262271

First off, a public thanks to Vic for the great AR8000 homepage!

Down to business...

Has anyone noticed a great deal of hissing when using headphones on the AR8000? On my scanner, this hissing is almost as loud as a strong signal with no voice, i.e. quiet. In fact, when in scan mode, if a signal like this is detected, it is *very* hard to even tell that the AR8000 has locked on to a signal or is still scanning. The hiss is audible the second you turn the scanner on.

Note that this hissing is *not* audible from the speaker when the headphones are not connected.

I am currently using a pair of Sony "in ear" stereo headphones connected to a high quality mono to stereo adapter. I don't think this has anything to do with it as I've taken the adaptor out and listened (with one ear) and still heard the hiss.

Also, I think someone was mentioning something about this, so for completeness, I'll state my observations here. I've found some strong signals on some frequencies I listen to that are there regardless of whether or not the antenna is attached. These signals do not show up on my 200XLT. What's the technical term for this? Birdie?

Thanks...

greg

>>are not available.

>Just wondering Les, if Part 97 is the rules for the Amateur Radio service,
>how can they apply to any other service. Sorry, but they can't.

>Although I agree that the radio was taken illegally, Part 97 is not the
>instrument (the paragraph you cited) that allows a person to use any
>means of communications in another service.

[snip]

It certainly does apply. It applies to the use of an amateur station. If such a station is capable, under the described conditions, of communications outside the amateur sevice, those communications are permitted under the above paragraph (97.403). In addtion, a station is distress can use ANY MEANS AT ITS DISPOSAL to attract attention, make known its condition and location, and obtain assistance - refer to 97.405. In other words, if my equipment provides out the ordinary capability, I am allowed to use it when ordinary means don't work.

However, in my situation, I would likely look for a system operated by my employer before I surprised a sheriff dispatcher. But my knowledge of other commercial systems put other means "at my disposal". Still, use of my amateur equipment on petroleum or business services would subject to the conditions of 97.403/405.

The purpose of these paragraphs is to cover just such an incident as occured in southern California.

Of course the real point of this thread is how useful is
two way radio communication is after the fall. One has
to assume that the FCC enforcement won't be too strong,
nor would 3 watt HTs on 440 cause too much interference even
out of band.

I might suggest that with roads blocked, telephone lines down,
power grids disrupted, and feral groups wandering around the
ruins that radio communication might be more important than
weaponry in putting up a coherent defense. The military
even deems it important enough to have a name for it: c-cubed.

A portable HT capable of out-of-band comm wil be worth more than it
weight in gold. Making them even more useful is that they operate
as scanners to monitor whatever official comms are still happening.

1194. What are those new LAPD radios?

Newsgroup: rec.radio.scanner
Date: 1995-01-25 19:30:52 UTC
From: hglassma@daniel.drew.edu
Message-ID: <1995Jan25.193053.115107@daniel>
Source record: 262239

I saw that the LAPD is finally replacing its antiquated fleet of Motorola MX-300 series portables with a new radio that looks like an updated model of the Motorola Saber.

They have what looks like two rows of three green buttons right under the display screen.

Does anyone know what these radios are called and what their capabilties are??

Thanks.....

>I've been reading this thread for a while, waiting for someone to
>write why it really is (probably; I'm no lawyer) legal for newspaper
>reporters to use scanners.

Why do you think it would be illegal for a reporter (radio, television, or newspaper) to use a scanner? How else would the media know about a major police or fire event?

A good reporter WILL NOT USE INFORMATION from the scanner. Instead, the reporter will lumber out to the car and drive to the scene of the event, or will lurch across the room to the phone and call the dispatcher.

In Columbus the police and fire departments are on an 800Mhz trunked system. The police department provided (once we paid them for it) a radio that's exactly like the ones in cruisers and fire equipment. It's programmed to the talk groups they want us to have, meaning "private call" conversations and special "tactical" information never shows up on the radio.

We use scanners to monitor the 19 voice frequencies so that we at least have a chance of hearing about someting that's on the "blacked-out" talk groups.

But having heard the information, no reporter at WTVN would ever go on the air and use the information directly. Once we have a clue, we get the story the old-fashioned way.

Hope that clears up your questions.

I agree, this is almost certainly baby monitors, and the frequencies they
use are precisely the same as 49MHz cordless phone freqs, although the
monitors don't use all the freqs that cordless phones do.

Hmmm, sounding like a teenager? I'll take that as a compliment. It is often young people who are unwilling to accept the status quo just because someone has put it in writing and called it a "law." And for what it's wroth, you're sounding like an old fart. The difference between us, I guess is that I'm willing to debate issues, if for no other reason than to listen to the other's point of view. And gee, Pops, you may be able to convince me of the soundness of your views if your supported them with logic, percision and clarity.

>unique to one individual but not duplicable by others.

In my case, this isn't the problem. I made quite sure that I wasn't pressing any buttons while I was turning the dial. The fact that the dial works fine when turned counterclockwise but screws up when turned clockwise indicates this problem is not user error. In fact, I just tried it again with the radio standing upright on a table so my only physical contact with it was my finger on the dial. Same result: it doesn't work when turned clockwise.

I suspect, in my case anyway, that the problem is related to a bad encoder combined with poorly written firmware. The encoder is probably sending spurrious signals to the CPU when I rotate it clockwise and the firmware can't correctly debounce the bogus data. I write firmware for a living so I know that this is a plausible scenario.

The cure in my case will be a new radio. Most encoders probably work well enough that the firmware doesn't have problems.

I tried this and the FM transmitter idea, but the drawback to these is that you can't listen to your car radio/tape/CD player while listening to your scanner. I'm sure some people don't listen to the two at once anyway, in which case there's no problem. Personally, I like to play the radio/tape/CD quietly on the two rear speakers in my car while listening to the scanner. To amplify the sound I use the Radio Shack amplified speaker. I hook it up directly to the battery (well, with a fuse, of course) in line with a heavy-duty noise capacity to eliminate alternator whine. I use the same feed to supply power to the Radio Shack car adapter, this reduces a lot of the radio interference that I would have to put up with if I plugged everything into the cigarette lighter. Also, this leaves the cigarette lighter available and doesn't clutter up the dash with lots of wires (everything is under the front seat). I removed the ampilifier unit from the speaker and put JUST the speaker in a much smaller "box" and attached that securely to the top corner of the windshield on the driver's side (note: if you do this, attach it well enough so that it doesn't become a projectile in a collision). The Radio Shack amplifier has enough output to actually allow to me listen to my scanner clearly while _outside_ of my car, such as while pumping gas. Since the setup goes right to the battery, I don't have to leave my keys in the ignition. Of course the output of the amp is a function of the output of the scanner, but I was using a PRO-62 (poor audio in my opinion) and there was more than enough ampilification.

All in all, I don't like the idea of having lots of wires floating around the dash area, I like to have my cigarette lighter available, as well as my stereo. If you want to go through the trouble, it's definately worth it.

>whatever STEPS you wished. The possibilities are endless!

From what little I have heard about the Commtronics, they control
the radio by pressing the keys electrically, so it won't work for blocked
radios.

There was an 8 wire interface between the microprocessor and the
PLL hardware on the pro-2006 which did band selection, and programmed the
PLL's... everything there you need to control the radio part (but not
the display.)

From what I've read, I inferred that the Opto 567 just plugs into this
8 wire bus. This is what you want. Okay, so what about new blocked
scanners?

If you look at the reviews of the pro 2035, they stole much of the design
from the 2006, including the keypad and general layout. It it likely
(would someone check?) that the 8 wire bus exists on the 2035 as well.

If it does, then Opto is probably already coming up with a solution
that uses their 567 hardware and potentially a change in software if the
pll changed, etc.

Ask them.

If you have identified a duplex system, particularly where one frequency is a bit stronger than the other, is it generally best to:

1) Put both frequencies in without delay, to switch between the two, and run the risk of something else butting in along the way;

OR

2) Putting a delay on the better one, so that you remain with the exchange but only get one side of it?

I tend to use the telescopic for around the house when the scanner is pretty
much stationary and needs to drag in a few signals.
If out and about, eg. at an airport, I would put the rubber duck back on
since the signals would be stronger and the whole thing generally a bit
less conspicuous.

The manual rates it at nominal 9V. But there seems to be no difference
between using 9V and 7.5V.

I suppose 6 Nicads x 1.2V = 7.2V

I am not sure what the maximum current drain is with it, so I tend to
lower the voltage a bit with an unregulated AC adaptor.

Here is an interesting article I picked up from a local BBS. Seems like the best explanation I have heard regarding the name "Ham". Guess if some one really wanted to check it out they could go to the Congressional Record for the dates listed as well as newspapers of the time. Anyway it sounds good. Hope you enjoy.

WHY RADIO AMATEURS ARE CALLED "HAMS"
From Florida Skip Magazine - 1959

Have you ever wondered why radio amateurs are called "HAMS"? Well, it goes like this: The word "HAM" as applied to 1908 was the station CALL of the first amateur wireless stations operated by some amateurs of the Harvard Radio Club. They were ALBERT S. HYMAN, BOB ALMY and POOGIE MURRAY.

At first they called their station "HYMAN-ALMY-MURRAY". Tapping out such a long name in code soon became tiresome and called for a revision. They changed it to "HY-AL-MU", using the first two letters of each of their names. Early in 1901 some confusion resulted between signals from amateur wireless station "HYALMU" and a Mexican ship named "HYALMO". They then decided to use only the first letter of each name, and the station CALL became "HAM".

In the early pioneer days of unregulated radio amateur operators picked their own frequency and call-letters. Then, as now, some amateurs had better signals than commercial stations. The resulting interference came to the attention of congressional committees in Washington and Congress gave much time to proposed legislation designed to critically limit amateur radio activity. In 1911, ALBERT HYMAN chose the controversial WIRELESS REGULATION BILL as the topic for his Thesis at Harvard. His instructor insisted that a copy be sent to Senator DAVID I. WALSH, a member of one of the committees hearing the Bill. The Senator was so impressed with the thesis is that he asked HYMAN to appear before the committee. ALBERT HYMAN took the stand and described how the little station was built and almost cried when he told the crowded committee room that if the BILL went through that they would have to close down the station because they could not afford the license fees and all the other requirements which the BILL imposed on amateur stations.

Congressional debate began on the WIRELESS REGULATION BILL and little station "HAM" became the symbol for all the little amateur stations in the country crying to be saved from the menace and greed of the big commercial stations who didn't want them around. The BILL finally got to the floor of Congress and every speaker talked about

the "...poor little station HAM". That's how it all started. You will find the whole story in the Congressional Record.

Nation-wide publicity associated station "HAM" with amateur radio operators. From that day to this, and probably until the end of time in radio
an amateur is a "HAM"

Police call is a great resource. More detailed and more expensive than
Police call, but certainly worth the extra dollars is the NY Metro/NJ
edition of Scanner Master ($29.95 from Scanner Master 1-800-722-6701).
It's not updated as often as Police Call, but contains a wealth of
information about the Police/Fire/Ambulance frequencies and more for the
NYC Metropolitan area, upstate NY, L.I., Farirfield Cty., CT and Northern
NJ. Includes such things as car designators, radio codes, precinct maps,
frequency uses, etc. Well worth the investment as a companion reference
to Police Call.

So I recently picked up a used AR1000XLT that i found in the paper. After some stomping of feet, pulling of hair, and cursing the human factors group at AOR, i think i am finally getting the hang of the, so called "User Interface". Being a Hardware guy i couldn't resist the opportunity to take it apart and have a look. Not to many surprises really, except one, the scanner is controlled by a 4 bit processor which has a serial port. It's a uPD75308GF made by NEC with an 8kB external ROM. So i am wondering if anyone has been successful at interfaceing to it. It sure wound be allot simpler to program those 1000 channels using my computer. Any takers?
I would also appreciate any "scanner tricks" advice from you AR1000 experts out there, like how to scan arbitrary banks, unlock a bank with out unlocking all locked channels first, jump through hoops.

Cheers Erik Wahlstrom

I posted this last time SS frequencies came up.

I heard the following transmissions from Mahwah NJ. Mahwah is 25 miles from Manhatten, 50 miles from JFK and 35 miles from Newark airports.

I used my Pro-43 with its stock antenna. I was inside while monitoring.

The following is a key to some of the frequencies.
* = Used by the USSS (United States Secret Service).
+ = Used by the USSS, WHCA (White House Communications Agency) and the White House Staff.

Freq. Identifier Time

167.025 Whiskey 18:30 'Primary Paging'
165.375 Charlie 18:40 * 'National Primary' "We have Albany"
166.510 Alpha 18:52 "Radio check"
167.025 Whiskey 18:58
167.025 Whiskey 19:05
167.025 Whiskey 19:10
165.785 Baker 19:17 * 'Escorts' (Static)
164.885 Oscar 19:50 + (Static then heard, "Call 8875")
165.375 Charlie 20:00 * "OK. At your convinence call 2908."
166.700 November 20:02 + "Anwser if you're there. Anwser."
166.700 November 20:09 + "Dial the operater. (static) Dial the operater. (static) Shemp."

165.375 Charlie 20:15 * (static)
167.025 Whiskey 20:19
166.510 Alpha 20:23 (static)
165.785 Baker 20:44 * "Alright. Give me a call before you call that. I have a new iteam for you."

165.375 Charlie 20:51 * "Baboos, Baboos. Please report to the security room."

165.375 Charlie 20:52 * "Baboos."
165.375 Charlie 20:52 * "You have to talk to Baboos at the airport
security room."

166.700 November 21:01 + "Dial operater three times."
165.785 Baker 21:05 * "We have a three car procedure."
165.375 Charlie 21:14 * "Any possible time you can give him a call."
165.375 Charlie 21:14 * "Can you switch over to Mike."
407.850 Echo 21:28 Ground-to-air WHCA mobile link

(static)

The next transmission was only a one-way conversation at my end. The conversation started at 21:31 and ended at 21:37
407.850 Echo 21:31 "Carter? It was medium raw. We could pump it up. (static) Yes...Ed fingers. (static) Yes. National Republic Debate. (static) I have to leave at 9 for the debate. I'm don't usually read this group (because I don't currently have a scanner), but I'm looking to buy one soon. I need some information as to what scanner to get that is still modifiable. I have pretty much narrowed the search down to a Radio Shaft re-branded model, so any pointers would be appreciated.

I am after a portable model, affordably priced, and thus think that I'll only be able to get a 100 channel model. If there are any 100 channel models that can be upgraded very simply (unlike the BC100XLT memory mod) that would be a plus. I'm also after full 800mhz coverage also.

Thanks in advance!!
Mike

I guess what I really meant to say is that when a public service agency
uses a radio, they know (or at least I would hope they would know) that
people with scanners will hear what they are saying. If they truly want
NO ONE to know, then they should use a landline telephone or face-to-face
communication. By the same token, though, I think that the agencies
should be able to use the radio without Joe Scanner calling up his 10
friends, who call their 10 friends, who form a crowd of 500 gawkers at an
emergency scene.

I think the problem here is that you don't understand what the scanner
information is used for. All media use scanners as standard equipment,
but the information heard on the scanner is almost never repeated (in my
case) on the air. Information that comes over the scanner is more often
than not (believe it) imprecise, or entirely incorrect. Reporters use
what they hear as a tip that something is going on, and contact the
appropriate agencies to find out the real story.
There was an extensive thread about this in the Society of Professional
Journalists listserv not too long ago.

> as long as it's not used
> for illegal activities or personal gain (etc). As I understand it,
> it would be public property and subject to the FOI act.

Your understanding is incorrect.

Tell you what. All of you who don't believe that it's illegal to divulge what you hear can go ahead and start recording and replaying police calls, etc to anyone who will sit still long enough to listen. Take your recordings to City Council meetings and use them to help make points in debate about public services. Send tapes to your local newspaper whenever you get anything "interesting".

Sooner or later, somebody WILL demonstrate to you the illegality and foolhardiness of your actions.

> So, if Fred the volunteer fireman heard a call on a scanner, then
> called his brother Ed
> (who is also one) and told him of the call, That would be illegal?

Absolutely. And before you ask why it's illegal to alert someone to a call for their own agency, I will ask you why Ed doesn't have a pager.

Victor, I really hope it works for you. A lot depends on where the lighter plug is and where your manual or automatic shifter is located. You may not have a problem.

I paid $17 for mine at Auto Parts Club. I don't remember the brand or model, but it was basically a no-name. It held the scanner fine, using a spring-loaded assembly with padded sides. The springs applied constant tension to the sides so I had to force open the "jaws" and insert the scanner each time. The only problem besides the stick shift was the potential for the whole thing to start rotating (sagging) if I rotated the scanner so its weight wasn't balanced vertically. Part of the reason I had that problem was because I had to secure the scanner in an awkward position to keep it as far away as possible from the shifter.

After returning that holder, I mail-ordered a product from Handi Radio Products (somewhere in the midwest). It can mount on the floor with screws or you can purchase a suction cup kit for window mounting. I ordered the suction kit. Total cost was about $46, I think. I found the ad for it in Amateur Radio. It works fairly well but the two smaller suction cups always pop off. Still, the two larger ones hold it well.

Good Luck!
-Randy

Hi There...

I use a 2m handheld in my car and had the same problem. Go to a dealer
that deals in Kenwood radios and ask for the TS-41 speaker. It's a little
cube about three inches on a side with a mounting bracket, and is excellent.

If you're wondering if it works, I drive a Jeep (not exactly quiet) and
rarely miss anything. I don't even have to turn the volume up much. The
sound quality is excellent.

Mike,

The advantage to a discone is that it is good for wideband reception. You are correct is stating that a discone has no gain. If gain is what you seek then you want a beam aimed at your intended reception area. I've got both the cheap and higher dollar Rat Shack discone as well as a sideways T.V. antenna connected to my scanners. They all perform very well for the purpose I chose them.

The best choice would be a tuned antenna for each band, If you have a tower and a few acres of land. Also a discone is reasonble to use near cities, since it has no gain, it may not overload your tuners front end with paging tower reception where it doesn't belong.

Try an Icom R-7000 or 7100 with software. With Radio Manager for Windows
I have 999,999 channel capacity, I can search any range from 25Mhz to
2Ghz, Create any number of banks of any size. Let the radio scan with the
P.C. and log any hits. Lockout birdies or data channels in search mode,
search in any step size I want and even use the same software on my
shortwave, with a different frequency list of course, 100Khz to 30Mhz.

I have a brand new, still in box scanner for sale. The Uniden Bearcat 800XLT base station was the last model manufactured that receive the 800 mhz band (Cellular PhoneS), before the FCC restrictions were in place.

The Bearcat 800XLT features:
* 40 channels
* 12-Band Coverage
* Crystalless
* Direct Channel Access
* Channel Lockout
* Simple Programming
* Manual Step-search
* AC/DC
* Steel Cabinet
* Two Antennas

This device is still in the box, and was used only once.

Paid $225 -- Sell $125 inc. postage

Interested parties should send an e-mail message to:

gblhotel@ix.netcom.com

Please include your phone number and the best time to call.

When on the 380-512 band on the Pro39, I extend all the bottom sections
of this aerial. The instructions for the aerial say "extend 1 to 3" bottom
sections.
So which bit is best left standing for cellular?
It also seems strange that it should be fully extended for VHF aircraft,
and shortened a fair bit from 137 onwards.

If you wish to scan a 150ish and a 450ish frequency in the same band,
is it generally better to leave the aerial in the 150 state or the 450
state or something else?

1257. Re: Diode assignments for Pro-43???

Newsgroup: rec.radio.scanner
Date: 1995-01-26 11:33:20 UTC
From: mulligan@ACM.ORG
Message-ID: <3g81a0$jfq@hopper.acm.org>
Source record: 262268

bartdoug@acusd.edu (Douglas Barton) asked about:
> ... the assignments for the D1-5 diodes on the Pro-43 ...

The diode functions are: D1 - enable keylock switch
D2 - enable 30-54 MHz
D3 - enable 54-88 MHz (nominally 68-88 MHz)
D4 - disable U.S. cellular
D5 - step cellular at 12.5 kHz (vs. 30 kHz)

If you have an international version of the PRO-43, there should be
diodes at D1, D3 & D5. The US/Canada version has D1, D2 & D4.

bartdoug@acusd.edu (Douglas Barton) asked:
> ... how do I get manuals for these radios?

Your R.S. clerk (he did not qualify as a 'salesperson') was either lazy or uninformed, or both (not uncommon).

Call: Tandy National Parts
900 E. Northside Dr.
Fort Worth TX 76102
(800) 442-2425
(817) 870-5600 (from outside the US)

Give them the catalog numbers of the radios and ask for the Service Manuals. They'll cost approx. $6-8 ea. Natl Parts takes plastic, ships immediately, and is the best run division in Radio Shack (damning with faint praise <g>). Your local store could call the same office, but they may charge a markup and will probably botch the order.

From: topaz@cc.lut.fi
Message-ID: <D30HHo.HzF@lut.fi>
Source record: 262179

Hi there!

I've been considering buying a scanner. Originally I was looking for
the Pro-43, but as it is, obtaining one is not so easy any more.
It is also a bit old, so I figured I might as well go for the new models.

I found a couple of interesting ones from the '95 RS catalog: PRO-51 and
PRO-62. They are both about the same price, have pretty much the same
frequency ranges and include about the same features. Since RF interference
shouldn't be too much of a problem I might take the extra speed of 51
instead of the triple conversion of 62. But the question is:

Are these radios in other respects about the same?

I know that 51 uses 4 batteries compared to 62. Do they last about as long
or do I get more with extra batteries (couple of hours more, better sound,
better lights, better reception, etc)? What else should I consider?

Those of you who have something good or bad to say about either radio,
please reply by email (Arto.Selonen@lut.fi) or directly here. If there
is enough interest (and information available) I'll post the summary here.

thank you,

Arto Selonen

Just thought I'd mention that most Frequency counters can pickup strong signals from the air as mentioned above but they can also be hooked up via a probe directly into a circuit if the goal is troubleshooting and adjustment for weak signals. This is really the most accurate way to use them.

If signals from a close source are desired than an antenna can easily be home brewed. A cable with a BNC on one end to attach to the counter leading to a bare length of wire or a sniffer loop of wire will work just fine. This way the counter itself can be located a distance from the transmitting source. If the counter itself is in close proximity to a strong transmitting source the oscillators within the counter may be overidden by the strong field thus really

screwing up the readings.

>the powered one 21-541.

Get the powered one. I have it in my car for my HT. The amplifier
shuts off after a few seconds if no sound is received, saving the
battery. I like it because I can hear it over the FM radio/CD player.
It needs a +12VDC source and comes with a ~6ft mini extension cord.
Sound quality is pretty good (definitely better than the -43's own
speaker). Cost is ~$15-$20.

The down side is that the jack is on the back of the speaker and not
the side, making it difficult to flush-mount on something. I wired my
own jack to come out the side of the speaker. You may also need a
power supply filter to cut the alternator whine.

You might also check at a ham radio store if one is nearby.

VA>He He. Well when I was 17 my buddies were getting busted for drinking
VA>beer down by a creek. The officer left his Motorcycle alone so I keyed
VA>the mike and used his number to do a QRS on his own plate! The dispatcher
VA>was totally clueless until she realized I had just called in the
VA>motorcycle. "37, that plate comes back to..... uh.... your motorcycle!?"
VA>The officer suddenly realized what was going on and forgot about my buddies
VA>and ran back to his bike. Of course I was looooong gone and so were my
VA>buddies! I though it was pretty funny, didn't hurt anyone, and my buds
VA>got off the hook. I don't think it was illegal, I mean I used the
VA>police's radio, I was a resident of that city, I was paying taxes, so, I
VA>guess I was using my radio.

Well there are those that will tell you that what you did was illegal
and potentionally dangerous , re what if the freq was needed for a real
police emerg comm. However, I am not one of these people. Bloody
hilarious!!! I take it you were off for a nature break at the time he
rolled up to investigate this serious offence<G>.
See ya

Hello folks!

I have a question. I have a double-conversion unit which employs up-conversion.
I get images of trunked systems and pager? activity where I don't want to
hear it. Is there a filter I can get to reject 848-869?
I've looked in a recent Grove sale catalog and the filters listed
didn't have the coverage I wanted.

Any info would be appreciated.

Thanks.

: --
WHAT? I'm been a tech since 1966 a counter is NOT a multimeter! Some
counters may have multi-meter functions but they are seperate and
distinct from counter functions. Further, many counters are not sensitive
enough to detect off-air signals. They don't need to be.

I disagree. If you have a cell phone, you can transmit over it anything
you want to, as long as you do it on your own bill. However, who would
be able to receive it? Scanners that will do this are illegal ;)

IMH(BC)O, it would be a silly thing to do.

: --

Oh, where do these people come from? A frequency counter does indeed
display the strongest frequency in the area. For example, drive up next
to the source you want the freq. for and wait for a transmission. Radio
Shack has an excellent freq. counter for general use for about $100.00.
My only gripe is that it doesn't have any memory or hold options.

: purchased in Japan (It is made in Japan isn't it?). How does it
: compare with the UK or US model in regards to what it can and
: can't do? How much is it retail out there?
: Thanks for any help,

Greetings,

Just returned from Japan (Osaka area) (yes I rocked and rolled =8*) and purchased my new AR8000 in the electronics town of Osaka. I wound up paying 59000 yen which depending on the exchange rates comes up close to $600. The shop I went to spoke almost no english and we used the pocket translators a lot. They did have an english manual for it and the ac adapter is 100V with the same plug as the US has, only approximately 2mm narrorer between the prongs. I haven't used the ac adapter yet, but I don't think that the 100V vs 120V will be a problem since it's a very low current device; maybe the adapter will be a little hotter running at 120V. Other opinions? An obvious difference is that all of the preprogramed bandplan is for japanese consumers, in katakana characters. Just plan on reprogmaing frequencies. Also picked up a "super slender" SH-85 comet antenna there; any opinions on this antenna? Oh, I thought I was being robbed on the case price of 2000 yen ($22), but it sounds like the going price is around $25 in the US.

Hope all this helps. ---:-)

I'm going to be in Korea for the next three weeks and it's a 2 hour drive
one way to the fab that I'll be working at. I picked up a magnetic mount
for a bnc antenna for my rental car and I'm wondering if anyone knows of
interesting freqs. Is their cell freq the same as in the states?
Anybody know of military freq that may be used? I'm using a AR8000 so
any shortwave freqs would be welcome also.

Thanks for all replies.

: Now all I need is my "Beyond Police Call". In the mean time, if anyone
: has the freq's for the TV, Newspaper and radio Media in NYC, please post
: them here. I would love to pick up an unusual crime on a police freq's and
: then here the News crew at work to report it for the Evening News.

: Rob

I found a text file listing some NYC media, but it's mostly traffic. I
have never tried them so I don't know if they are any good.

Well here are a few more for you. I didn't know about WOR's frequencyand I
believe the WFAN frequency is wrong. WFAS-FM uses the frequency 450.650:

452.9750 Shadow Traffic F-1, Operations (PL 103.5hz), input 457.9750
450.8375 Shadow Traffic F-2, Westchester (PL 103.5hz), input 455.8375
453.0000 Shadow Traffic F-3, New Jersey (PL 103.5hz), input 458.0000
(Anybody know the F-4 frequency and what is it for?)
455.5625 Shadow Traffic F-5, Production (PL 103.5hz), simplex
Also WINS-AM
450.1375 Shadow Traffic F-6, Connecticut (PL 103.5hz), input 455.1375
450.8125 Metro Traffic, Production (PL 67.0hz), input 455.8125
450.0875 WCBS-AM, Production (PL 94.8hz), input 455.7000
This is also known as Shadow Traffic F-8 and is used by AIR-9
(a Shadow Traffic reporter) for Suburban Sky Patrol reports.
450.5626 WALK-FM, Production, simplex
450.6500 WFAS-FM, Production, simplex
To make this list complete:
450.2500 WOR-AM

Your right the bernstein book is a real bonus.
Someone sent me a pointer to "The Guide To The AR1000"
from the Electronics Equipment Bank in Vienna VA.
Can anyone give me a comparison? Also How about posting
a reference to that newsletter, name, date, issue, etc.
Or forward my name and E-Mail on to m. alexander, if you can.

Kai, I am looking for the major law enforcement, fire, news station and
LAX and Burbank airport freqs. Also, if there are any emergency area-wide
channels that are used for major disasters (floods, earthquakes, etc.).
Any help would be appreciated. Thanks. Mike.

> I am looking for suggestions on a good, cheap way to get a spectum
> display hooked to a R7000, AR3000A, or Pro-2005.
AOR in the have released a spectrum display add-on for the AR3000 at
about 600 pounds sterling. You can use it with other scanners with a
10.7 MHz IF but you then have to do some instant arithmetic to get derive
the actual frequency.

The Standard model you refer to didn't have a true spectrim analyser
facility - just the ability to get a display of activity of a few
adjacent channels - just like the AR8000 has now.

rsharp@paul.spu.edu (Ornery ol Ron) asked:
> ... cell ... what should be the start frequency and the end frequency ...

From the FAF - Frequently Asked Frequencies
on ftp://oak.oakland.edu
as /pub/hamradio/docs/misc/scanner.faf

Cellular Telephone [22.902]

Chs Freqs (base) System

800-832 869.040 - 870.000 RCC - voice
1-312 870.030 - 879.360 RCC - voice
313-333 879.390 - 879.990 RCC - data
334-354 880.020 - 880.620 Telco - data
355-666 880.650 - 889.980 Telco - voice
667-716 890.010 - 891.480 RCC - voice
717-799 891.510 - 893.970 Telco - voice

Mobiles transmit 45 MHz below the base (824.040-848.970) and
are usually repeated by the base. Channels are 30 kHz apart.

Or you can save all that shipping time...

(I've done)
PRO-2006 -- cellular mod

a. Unplug power. Disconnect any other cables or antennas.
b. At the back, remove the screws holding the cover on.
c. Remove cover.
d. Find diode D502 on circuit board behind the numeric keypad. (Near the top
of the unit.
e. Cut one leg of the D502 diode.
f. Spread the leads apart.
g. Reassemble.

PRO-2006 -- 15% scan speed increase

a. Perform steps a-c, above.
b. Find diode D503 on circuit board behind the numeric keypad. (Near the top
of the unit.
c. Cut one leg of the D503 diode.
d. Spread the leads apart.
e. Reassemble.

(I've seen)
PRO-2022 -- cellular mod

a. Unplug power. Disconnect any other cables or antennas.
b. Remove the screws holding the cover on.
c. Remove cover.
d. Find diode D44 on circuit board.

e. Cut one leg of the D44 diode.
f. Spread the leads apart.
g. Reassemble.

By all means, if it looks too tough after openning it up avail yourself of this or the other opportunities out there.

Frank

WRONG,
A frequency Counter is NOT a multimeter for measuring Current,
Voltage, resistance and such. It is a FREQUENCY COUNTER. It counts
frequency. There are some models of Multimeters that have a Frequency
Counter in them as a sort of multi versitile testing device, but usually
those counters onlt go up to about 4 MHz.

A good counter will measure from about 10 Hz upto 3 GHz (covering AF to
RF), depending on what model you buy.

Example: IF you have a CB set tuned to Channel 19, and a counter nearby,
the counter should read approximately 27.185.00 MHz or close to that,
when you keyed the mic. That is if you have the equipment set up
properly. If for example the counter showed 27.180.00 MHz, then that
would mean that you are off frequency, and either you need to repair the
problem or get someone else to.

Now do you know what a frequency counter is?????

I bought a scanner from ACE without incident several months ago. However, in this case, I bet the problem is that ACE simply can't get the unit (I'm assuming that you're after a no-gap model). I'd cancel the order and try someone else, like Tucker.

From: nek@cbnews.cb.att.com
Message-ID: <D32H4F.9L5@nntpa.cb.att.com>
Source record: 262001

I need a little help here, I was just given a BC855XLT scanner and
don't know where to start.

What are the capabilities?
Can I get a better antenna, and if so which one?
What frequencies can I obtain?

I hope there is somone out there that can help me along with this.

Any help will be appreciated.
Thanks in advance!

Is this considered a good radio?

I'm sorry to see SPEEDX go. I liked the format of Shortwave Radio Today.

Although I'm not a utility enthusiast, I imagine those who are will
especially miss SPEEDX, since it seemed to be the only club that featured
much in the way of utility logs and info.

I haven't seen any postings for modifying Radio Shack Pro-23 scanners.
Has anybody attempted such a feat, or do I have a low-tech scanner that
isn't worth the bother?

Look at the positive side. It may encourage those readers of SPEEDX to think about getting a computer and getting on the Internet. Here they can share their knowledge and logs with thousands! I couldn't believe the number of people I queried at the '94 MT Convention who never heard of Internet. With the advance of technology more and more will have access to it. It sure is faster and cheaper than US Snail and the printing costs of a paper base letter. Of course electronic logs can be keyword searched, etc. etc. But I'm preaching to the choir, or am I?

Steve I noticed an article featuring that scanner in
Popular Science or some similar magazine while
killing time in a grocery store.

I think it was pop science since I read an article
that was rather interesting about the Titanic instead
of the article about that sportcat scanner. This was just
a few days ago so it may be a current or new issue.

> Somone else suggested scanning 896 to 925. Do you concur? Do you
> know how many channels this radio can operate on?

If it's on a trunked system then it can operate on a number of channels. About the only way you'll figure out which system it's on is to listen to that range and try to hear that particular user. If you have the radio then take it to a Motorola dealer and have him read the codeplug.

Knowing the make of radio does narrow things down somewhat but you'll still have to search out the frequencies with a scanner.

If the police had more time available to them, they could probably interview some of the gawkers and find out where they live. If they don't live within sight of the scene, then they should be asked how they found out about the incident.

As I think about where this idea is going, I find that I'm suggesting activity by the wrong law enforcement group. The FBI should interview gawkers at emergency scenes, because they have the power to arrest people just for violating ECPA or the Communications Act.

knob-:on the ftp site that I usually check (oak.oakland.edu).

There are two that seem to work, depending on "which" 7A4 you
have. Some can be enabled by a simple 2 + 9 + Lockout (all three keys
held down when unit is off, then power on with the keys held down).

Another 7A4 (the one I have) needs one additional step. Hold down
2 + 9 + BAND, then power on radio. This will put the radio in test mode
where all digits on the LCD come on. While its in this mode, press and
hold down 2 + 9 + Lockout for a few seconds. The test freqs will then be
inserted.

: KD6ELA / GROL PG10-25691 / Pvt. Pilot ASEL

It looks like KO6EB is a product of the VE testing system.
If you can memorize the answers to some questions, you can get a license.
At lease he knows what part of the CFR governs the service he uses.
The VEs here do not even randomize the answers to the questions.

In another few years the "virus" that has infested amateur radio (the KO6EBs)
will render the hobby useless and the EIA will have it's way.
Amateur radio will go the way of CB and the frequencies that we have left
will be taken away and auctioned off to the highest bidder.
As happened to 220 MHz and UPS.

The Telephone Pioneers here have a 220 MHz system state wide.
It went up shortly after Hugo hit.
It does not take a rocket scientist to figure out why Ma Bell financed
this system.
Its much cheaper to finance a radio system in the ham bands than it is to
buy the frequency and license it.
In time of disaster the Pioneer 220 MHz system will most probably be used
for commercial traffic.

This is what the KO6EBs do for us.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993, 1994, 1995 by Bob Parnass, AJ9S |

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Introduction

The original Bearcat scanner line was manufactured by
Electra of Cumberland, Indiana. In the mid 1980s, Uniden
bought out the Bearcat scanner line and Uniden's first
Bearcat scanner was the 800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s. Electra stamped all of its scanners with a
manufacturing date code on the rear of the cabinet. The
code is comprised of a single character (C = Cumberland,
Indiana, P = Puerto Rico), followed by four digits denoting
year and week the radio was built. For example, "P8422"
denotes the radio was made in the Puerto Rico factory
during the 22nd week of 1984.

Schematics and Parts Available

Schematic diagrams may be obtained from Uniden/Bearcat's
parts department, (317)842-2483.

G & G Communications (telephone 716-768-8151) is a family
owned company which repairs scanners and stocks parts for
several older models, especially Electra/Bearcat and
Regency brands. They are located at 9247 Glenwood Drive,
LeRoy, NY 14482.

Electronic Repair Centers in Franklin Park, Illinois |
(telephone 708-455-5105) has been repairing Bearcat
scanners for several years. They charge a flat $45 repair
rate for programmable and $30 for crystal scanners, and
shipping is extra. Electronic Repair Centers will fix

Regency scanners if they can obtain the parts.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 scanners I've fixed, C98, a | capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The

22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I replaced the 22 uF capacitor in the switching power | supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate | pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two

BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Other Problems

Complaints of low audio output and occasional microphonics | in two Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as

identified in the table below.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35 33K	replace with 220K. Located between pins 12 and 14 of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K	try 220K.
Radio Shack PRO-2004	R148 47K	remove R148 or replace with 220K. On linear board, between pins 12 & 14 of TK10420 (IC2)
Radio Shack PRO-2022	33K	replace 33K with 220K. Between pins 12 & 14 on IC-1 MC3361
Radio Shack PRO-2035	100K	replace 100K

	with 220K.
	Between pins 12 & 14
	of TK10420 (IC-2)
Electra/Bearcat 220	R75 2.7M may be ok as is
Electra/Bearcat 20/20	R75 2.7M may be ok as is
Electra/Bearcat 250	R66 2.2M may be ok as is
Uniden/Bearcat 760XLT	R58 22K replace with 6.8K
	or other value.
	(select value for
	the particular radio.)
	Located on pin 14
	of MC3359P IC
Uniden/Bearcat 800XLT	R91 860K replace with 2.2M.
	Located on pin 14
	of MC3359P IC
Plectron P1	R81 180K may be ok as is
Plectron 700	R96 180K replace with 560K

1320. ? CTCSS option for BC2500XLT

Newsgroup: rec.radio.scanner
Date: 1995-01-28 15:20:36 UTC
From: dave3rd@interlog.com
Message-ID: <3gdnj0$pde@steel.interlog.com>
Source record: 262096

Hi,

Does anyone know of a CTCSS option for the BC2500XLT. Also, any ideas on how to add a PL tone decoder to a Scanner. You would think for the price of this unit, it would have had these options already - Arghhhhh!

Thanks,

Dave

An easy fix for earphone hiss is to add a 1k to 2k ohm resistor into the
plug. Cut off the old plug, add a small (1/8 watt) resistor in series
with the earphones.

>someone within shouting distance who could summon further help,
>signalling mirror to signal an overhead airplane. Otherwise, no
>fair grumbling if your HT gets taken away and you receive a NAL.

1: If you read the original post, you would have known that there were
no ham repeaters in reach.

2: If you had read the original post, you would have known that the HT
was confiscated by the sherriff's office, which has no legal authority
to do so.

3: Do you know for a fact that this ham was carrying a cell phone? If
he was not (I don't know if he was either) then the cell site would be a
moot point, since HT's dont work with cell sites.

4: There is a good chance that even if the ham was carry a cell phone,
it would have been as useless as the ham band, if not more so. The
sherriff's office had arranged full coverage of the are by their repeater
out of necessity. Both ham repeaters and cell phones are luxury items,
so maybe not as much effort was made to get the coverage. Cell sites are
purposely short-ranged anyway.

I await your reply.

US phones are relatively common over here, as more and more people bring them back or receive them as gifts. No, they're not legal. DTI-approved cordless phones are in the 47.45625-47.54375 MHz range. US phones fall nearby, but in the range allocated to cordless mics, baby monitors, etc. Therefore, interference is low.

Well I know there was nothing dangerous about it. I didn't hear any thing going on and they have 2 freqs so if they got a real emergency they could have switched to F2. If it was a true emerg then they would have put the QRS aside. We were playing frisbee on the grass when he came up and looked around. He asked if we saw anyone and, well, we really weren't paying attention:-) It couldn't have happened to a nicer cop. He's a real ***hole. I know a few officers in that city and they all say he's quite a prick. I told a few of them about it and they got a quite a laugh out of it. I can't wait till I see his bike alone again :->

The Los Angeles Times recently had an article on how the slang
used by the LAPD varies from area to area within the city.
One example they used was the term "gimme" to describe a cheap
handgun. This is derived from the phrase "gimme all your money".
While one division of the LAPD uses this extensively, other
divisions do not use it at all.

Most are trunked, but try (from Monitor America):
47.66 MHz Transfer and Morgue Units
477-478 MHz (for example, Citywide is 478.0125, Command is
478.0125)
855.4875 MHz (Manhattan North Dispatch)
854.9875 MHz (Brooklyn South/Staten Island Dispatch).

> I know you can enter text labels for each channel, but I thought you
> could have a label for each bank. How?

Unfortunately not possible. I just print out a small (credit card) sized "Guild" to the search and scan banks. Good enough I guess.

Labeling banks is just another reason why the computer control program will be nice (in addition to infinate banks and banks with any number of channels, and full text comments, and autostoring an infinate number of search hits?). Only problem is getting the radio far enough away from the computers RF.

From: jeffrey@math.hawaii.edu
Message-ID: <D354Gp.GBz@news.hawaii.edu>
Source record: 262133
Cross-posted to: misc.survivalism,rec.radio.amateur.misc,rec.radio.scanner,alt.2600

Why are you cross posting this to so many groups, Glenn?
I've taken Dana's suggestion and directed this to rec.radio.policy.

critter@wizvax.wizvax.com (Glenn C. Lasher Jr.) writes:

>Jeffrey Herman <jeffrey@math.hawaii.edu> wrote with respect to
>the Part 97 wording ``...when normal communication systems are
>not available.'':

>>So before you use your HT out-of-band to call for help you'd better
>>make sure none of the following are nearby: pay phone, cellular phone,
>>CB radio, amateur repeater, amateurs monitoring a simplex frequency,
>>someone within shouting distance who could summon further help,
>>signalling mirror to signal an overhead airplane. Otherwise, no
>>fair grumbling if your HT gets taken away and you receive a NAL.

>1: If you read the original post, you would have known that there were
>no ham repeaters in reach.

Do you mean the original post from two years ago? Yes I read it and
I recall there was an FCC official present when the ham was given
the option of donating his radio or face charges. But that event
is on a distant vertex to the present discussion. Currently we're
analysing Part 97 regarding the issue overall. The `>>' quoted
above is my interpretation of what ``...normal communication
systems are not available'' means. I'm just trying to prevent
someone from having to go to court to justify their out-of-
band transmission.

>2: If you had read the original post, you would have known that the HT
>was confiscated by the sherriff's office, which has no legal authority
>to do so.

See the above. Also note that an FCC official was present, and that
there is only one r in sheriff.

>3: Do you know for a fact that this ham was carrying a cell phone? If
>he was not (I don't know if he was either) then the cell site would be a
>moot point, since HT's dont work with cell sites.

We're discussing this in the abstract, not with respect to a particular
event. Did you just start reading this? Which newsgroup are you on?
Come join us over on rec.radio.amateur.misc, for you must be on one
of the cross-posted groups that just picked up this topic.

>4: There is a good chance that even if the ham was carry a cell phone,
>it would have been as useless as the ham band, if not more so. The
>sherriff's office had arranged full coverage of the are by their repeater
>out of necessity. Both ham repeaters and cell phones are luxury items,
>so maybe not as much effort was made to get the coverage. Cell sites are
>purposely short-ranged anyway.

Again, we're not discussing a particular event. It sounds to me that
you're trying to justify transmitting out-of-band; remember, first
check to see that ``...normal communication systems are not
available.''

>I await your reply.

If you had carefully read what I wrote in the context of the discussion
you wouldn't have to waste your weekend awaiting my reply!

I read in the newspaper today that President Clinton is due to visit Lake Mary on Friday, as part of an education ceremony put on by Siemens/Stromberg Carlson. It was front page, local & state, bottom, Saturday a.m. edition.

If you are a radio scanning enthusiast, it's time to break out the federal frequencies and see what's happening. The President always has an advance team come in for security setup. Should offer some golden opportunities in central Florida, especially north Seminole County (Lake Mary).

If any of the amateur radio guys see this, it should be announced on the ham net on Sunday night at 8pm - repeater 146.73 mhz. Reception was poor last week, I hope its better this weekend.

1356. Using GATT to repeal ECPA?

Newsgroup: rec.radio.scanner
Date: 1995-01-29 06:06:36 UTC
From: tim@tbd.oau.org
Message-ID: <sBzKvA+LBh107h@tbd.oau.org>
Source record: 262122

On page 4 of the current Monitoring Times (February 1995), a letter from Robert Thompson indicates international trade policy might be one way to tell the cellular industry lobbyists, congress, and the FCC to go "f" themselves.

Mr. Thompson states, "any signatory nation that is being economically damaged by the cellular-capable scanner ban may file a complaint with the Dispute Settlement Body of the General Council of the World Trade Organization under the Uruguay Round! Any nation that is being harmed may file - including Cuba!...Let us all rally around our less friendly global neighbors!"

Now I KNOW representatives from the FCC read this group because one of them was stupid enough to call a friend of mine, posing as an interested hobbyist of course, wanting details of where to import full coverage receivers, where to get blocked scanners modified, would he modify them, etc. after he posted several comments in this group telling everyone to IGNORE the law. Yeah, bozo, you don't think he didn't see right past your interests when you wanted the full details on so many things? My question is are there any experts on trade policy and GATT that would care to comment on the letter that appears in MT?

It's refreshing to see that the Bob Grove of old has returned. In several issues of MT last year he appeared to be selling out to the FCC with his less than accurate statements regarding the importation of full coverage receivers. Now his ads for the PRO-2006 no longer state the only way to buy a full coverage scanner is to purchase one "from stock imported BEFORE April 26, 1994." His self-serving paranoia regarding monitoring is no longer there as evidenced by the latest "Closing Comments" column, page 120, February 1995 issue MT, "So what are the practical consequences [to the amending of ECPA '86 to include cordless telephone monitoring]? None. Consumers will go on using their cordless phones with reckless abandon, and scanner listeners who are so inclined will keep on intercepting their calls, just as they have for some twenty years."

Welcome back to reality, Bob! I told you and everyone else that back when the pages of MT were filled with so much crap regarding the monitoring of cellular one wanted to reach for a bottle of Pepto. Nice to discover you listen to more than just radios every

once in a while.

Let's face it. Unless you've been locked up in a federal prison
somewhere for the past year for monitoring a local politician
as he spoke on his cell-phone about ways to steal your money, you
KNOW where to get full coverage receivers. If you DON'T then
you probably don't have the mental capacity to operate a scanner
anyway.

Does the latest change to the ECPA of '86 mean that Aunt Martha
is a criminal because she picks up her neighbor's cordless phone
conversations on her dental work?

UK cordless phones will work in the USA, provided you aren't concerned about local regulations and you take some precautions:

1 UK line voltage is 240 volts 50Hz AC as opposed to the USA 115 volts 60Hz AC. The difference in AC frequency isn't significant for this purpose but the voltage is - you will need a transformer

2 UK phone plugs/sockets are different from the US RJ-series. You will need to replace - it's not that difficult.

3 The UK frequencies are different from the US - at 47MHz and approx 1800 KHz. You need to establish that 47 MHz is not in use in your locality for something else - TV perhaps?

4 Although prices have dropped, UK cordless phones tend to be more expensive than the US equivalents

Source record: 262129

I believe someone here said the various codes used by police were developed to confuse scanner enthusiasts or anyone else who might be listening in on their gtransmissions.

Not true.

The codes were developed simply as a means to keep actual time on the air as brief as possible while getting the basic message across clearly. It takes much less time, for example, to say, "10-23" or "I'm 23" than to say, "I'm arriving at the site you've just dispatched me to." The differences in codes between departments or between divisions of large departments developed in much the same way as different languages developed between groups of people. Radio codes have been around longer than scanner listeners.

Well, it would work for cellular, and would extend into other bands
(400-500 MHz), but wouldnt be exactly 'high-gain' on other bands, and of
course, the farther away from 900 MHz you went, the worse the reception
would be (yes, there is improvement at the "multiples" of 800-900 MHz,
such that, if it were a 5/8 wave at 800-900, it might be a 1/4 wave at
300 or something... needs to be figured out)... he best way is to plug
and play and see how you like the results.

1371. Viewing AR8000 HTML pages

Newsgroup: rec.radio.scanner
Date: 1995-01-29 18:11:19 UTC
From: Victor Healey Ki4je <vhealey@crl.com>
Message-ID: <3gglo7$3no@nntp.crl.com>
Source record: 262140
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.shortwave

Possibly you saw this weeks issue of PC Mag.
The whole issue revolves around paperless information
publishing. I choosee the www to publish information
I collected on the AR8000 hf/vhf/ scanner receiver thru
the url
ftp://ftp.crl.com/users/ro/vhealey/www/ar8000.homepage.html

I recomend Netscape for the web browser as its current
version is light years ahead of the rest and its free!

Available for all popular desktop environments, Netscape is a powerful commercial
navigator for the Internet, offering
point-and-click network navigation. It is optimized to run smoothly over 14.4
kilobit/second modems as well as higher
bandwidth lines, delivering performance at least ten times that of other network browsers.
Netscape provides a common
feature set and graphical user interface across computers running the Microsoft Windows,
Macintosh, or X Window System
operating environments.

Netscape Communications' network navigator achieves its dramatic performance improvements
through new capabilities
such as:

Continuous document streaming, enabling users to interact with documents while they are
still being downloaded
rather than waiting for the entire document to load.
Multiple, simultaneous network accesses, allowing several documents or images to be
downloaded simultaneously.
Native support for the JPEG image format.

Netscape, available for Microsoft Windows, Apple
Macintosh, and X Window System environments,
can be obtained via anonymous FTP from
ftp.mcom.com. Users of other network browsers
can FTP the software from ftp.mcom.com.

Customers who download the software do so for
personal use only. Commercial users can purchase
supported, licensed copies of Netscape directly
from Netscape Communications. Pricing starts at
$99 per user, which includes a 90-day warranty and
customer support.

Suppose you are running a PC without full internet access?

The solution is to ftp to my site ftp.crl.com/users/ro/vhealey/www/
and download all files exactly as they are listed except the last
portion can be .htm instead of the .html which is unacceptable
in old dos /win on a pc.

Get a copy of netscape via ftp also. Get a null winsock via anon ftp
also so you can run Netscape offline or else get tcpman and don't try
to connect to anything, just run the program and then launch netcape.
From file menu select open file <ctrl. o>. Locate the directory
you stored all your downloads from my homepage. Click on any file
that ends in htm and you can see it as well as any embedded graphics.

You can follow any url as long as it pointed to something at my site.
After you see what you could find all over the world using a true web
browser via a slip or ppp connection is you are calling via dialup,
you may want to look into getting your own full connection or
look into tia a neat way to beat the pricing of slip /ppp.

Others have www pages far nicer then mine. But I do this as a
hpbby related pastime.

The ar8000 homepage is updated at least once a week. Actually the files
pointed to by ar8000.html and andmore.html are updated weekly.
The ar8000.homepage.html merely points to these later two choices
and allows faster loading of shorter pages.

I hope you look into html as way to publish info for others,
it is easy to use. Just view the code of some of my recent pages
using a text editor. The older ones are rather confusing as I was
confused myself as to what was required. <grin>

Hi there...

Also, if you happen to live in the styx and they still use rotary dials
for dialling (don't laugh, my sister still does... touch tone doesn't work),
european phones use a different make/break ratio on the dialling pulses.

Dale Gadd (dalegadd@aol.com) wrote:
: I have eight PRO-43's remaining, new with manuals and in original boxes --
: all manufactured in 1993 before the CPU block was implemented. All have
: FCC ID numbers without the trailing A and all have production codes that
: end in A3 (5A3, for example).

I am just getting into reading about scanners, and am worried about getting one with restrictions and limitations imposed by the government. Could someone point out what recent restrictions and limitations have been imposed? What is the CPU block that Dale is referring to?

When an ad says a scanner is a "100 channel" what does this mean in terms of frequency coverage? A rundown of the frequency ranges would be helpful.

I would like to get a quality handheld that has a very wide frequency coverage. What are the general brand names available and their approximate performance? Which models don't have the "limitations"?

Thanks for helping out a newbie.

I have a couple of questons about SCA broadcasts that I would appreciate if anyone could clarify.

1. What is the typical/max bandwidth of an SCA broadcast. I want to know how good a quality sound can you expect from an SCA broadcast. I seem to recall seeing an SCA kit in one of the electronics magazines with stereo output. Is that possible?

2. Do FM stations ususally broadcast only one SCA program? I.e. is it possible/normal for a station to send a program at 67KHz and another one, say at 92KHz?

Thanks.

: differences in the two radios?

The 2005 CAT. NO.20-144 has a high/low switch for the display.
Scanning rate 16/8 channels per sec.

The 2006 CAT. NO.20-145 has the same high/low switch arrangement and the
scanning rate is 25/13 channels per sec. "HYPERSCAN"

The 2006 CAT. NO.20-145-A was the last version and it has only on and
off switch for the display light.
Scanning rate is the same as above 25/13. "HYPERSCAN"

all 3 models are cell modifable and there is a way to speed up the
scan rate also. All info I quote is off the boxes from the scanners.

The opto456 add on board ups the scanrate to aprox. 50 channels per sec
but that seems to be dependent on software.

1396. Re: Cellular channel/Frequency chart as asked for

Newsgroup: rec.radio.scanner
Date: 1995-01-30 06:16:15 UTC
From: gtolar@blkbox.com
Message-ID: <3gi07f$ke3@news.blkbox.com>
Source record: 262164
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Does anyone have the cellular channel frequency list newer then this?
The previously posted and all others I've seen are the 666 channel system.
Cellular has had 833 channels for some time now.

I have noticed that on the schematic for the Bearcat 890XLT there are two pins on the CPU labelled "RXD" and "TXD". These signals are brought out to a 3 pin header on the control PCB. Makes me wonder if Uniden intended them as a computer interface - does anybody know for sure ?

Thanks,

Ken Navarre (kjn@netcom.com) wrote:
: Anyone here in California have a listing for the frequencies used to
: broadcast the ASCII EDIS bulletins in the metropolitan areas?

I believe we are receiving EDIS on 39.32 or 39.36, but realize that it is a packet system you you have to have a TNC between your radio and either a printer or computer to receive the information. In northern California it is a different frequency.

It has been my experience as I commute listening to the scanner and some AM radio station (like KGO). That the scanner information is correct (provided you know what to listen for) while the _very_ delayed reports heard on the radio station are usually quite inaccurate (based on the nuber of incidents I witnessed first hand). I find it strange that the media would trust a spokesperson for an agancy over the collective traffic heard from the scene of the incident.

Source record: 262041
Cross-posted to: rec.radio.scanner,rec.radio.amateur.misc

I am new to this, but I am wearing my asbestos boxer shorts, so flame away if you feel the need.

My brother has started racing SCORE off-road (Baja 1000, etc.), and I have offered to run chase & logisics support for him. The radio he has in his racecar has 10 channels in the ~ 150 to 153mhz range for communications with various pits and race officials. The only radio equipment I currently have is a CB in my truck and a Uniden BC200XLT scanner.

First question:
I found out the antenna on my scanner only works when he is within a few miles of me. Other teams use a large antenna mounted on a mast. Could I use a 2 meter antenna and tune it for reception in this range? Or better yet does someone have a good design (I have much more time, tools, and materials than money) for a omni-directional antenna? The connector going into my scanner is a male BNC.

Second question:
Once I have a good antenna, could I use a tubular aluminum pool brush handle for a mast (~20' long)?

Thanks in advance for any help!

Dave

\\\\\\\\\\\\\\\\\\\\\\\\\\\\ UTILITY NOTES ////////////////////////////////
News and Information from the World of Utilities
Richard "RD" Baker, Editor
Internet: ae411@yfn.ysu.edu

Well this is it! The month we find out who has been naughty and who has been nice!

Many fellow Speedx'ers heard some of the great wargame communications heard recently on 6780.0 USB. Heard was what may have been some sort of multi-national exercise or wargame involving U.S. and South American navies, based on the accents. This was with S2 working B4. Referred to was a place called "Isla de la Plata" where units were ordered to proceed and defend. Jim Navary looked, but couldn't find that name that on a map. SEAHAWK 2 (possibly an SH-60 'Seahawk' LAMPS helo deployed by one of the ships) at one point reported that he had been advised on the "umpire net" that he had been "taken out". Lots of "weapons free" and "birds away" traffic with simulated and perhaps live-fire missile exercises. Was interesting stuff. Signals were "barely heard" in Michigan to strong in Virginia.

When I listed all the Russian RTTY books in the column a couple months ago, I didn't realize another was so close to release. Just released is the Hobbyist's COMINT Russian Radioteletype Dictionary by fellow Speedx'er and the author of the Hobbyist's Guide to COMINT Collection and Analysis, Tom Roach. One again in the spiral bound format and containing some 58 pages, the book lists Russian words created by three types of files: 1. Transliterated Cyrillic "Pakratt Code 3" output; 2. Universal M-7000 decoders "printer output" and 3. Transliterated equivalent of the Universal M-7000's "printer output". It features ONLY words used in actual traffic, including jargon. It also doesn't require you to know any Cyrillic alphabet characters. In short, with this dictionary, which is planned to updated continuously, you should almost always be able to get the gist of what is being sent in a Russian RTTY or CW message. Only "real" captured traffic was used to form the basis of the dictionary.
The "Hobbyist's COMINT Russian Radioteletype Dictionary by Tom Roach is available direct from the author at 1330 Copper Peak Lane, San Jose, CA, 95120-4271 with a cost of $30 USA (plus $4 shipping/handling 2 day priority mail); $37 (overseas, all countries, shipped Air Mail). The book will also be available through other dealers soon. All orders direct from Tom include air mail shipping, but no credit cards accepted. If you are one of the many who enjoy chasing Russian (and all of the former Soviet Union, et al) RTTY or CW, you will want to include this book in your reference library.

MILITARY
Many of you have noted several frequency changes starting mid-November. The U.S. Coast Guard changed some longtime air to ground frequencies. 11201 is now 11202; 8984 is now 8983; 3123 is now 3122. For now, 5696 remains the same. Canadian Forces frequencies 9006 and 6683 are now 9007 and 6684. Note all frequencies end in ".0" and are USB. The USCG changes are suppose to be part of a DoD plan to realign some frequencies to make room for new ones. Perhaps the realignment is wider than just the U.S. DoD considering the Canadian changes. In any case I'm sure there will be more. If anyone else has noted any changes worldwide anywhere, I'd appreciate hearing from you! I'll post an update next month.

Canadian Forces
~ For those who keep lists, HMCS Fraser (DDH-233) was decommissioned

October 31, 1994. Her international callsign was CZFG, and CFARS was CIW8103.
~ Some active frequencies you may try to log are 6694 and 6705 for CFB Shearwater, or Shearwater Military. The Canadian government is going to downsize the base starting next year, with most of the base to be transferred to civilian use. These frequencies are reported to be in use there.

~ Last year we had Tim Brauns' mystery station CGF on 6504.0 Khz., that was heard working Canadian Coast Guard icebreakers. In a QSL letter I received from a Canadian Coast Guard icebreaker, they describe CGF as being "Ice Halifax". The icebreakers maintain a schedule with CGF all winter long at 1320 Z and 1900 Z, usually on "four megs". Four megs may be 4363. Rick Matthew up in Vancouver also dropped a note suggesting CGF may also use 4318, 8725, 13140, 17326 and 22780. I assume CGF is like the U.S. Coast Guard CommSta Boston, NIK, their callsign for the International Ice Patrol. So this is about 90% of the puzzle solved. Now who actually runs CGF? And can we confirm the International Ice Patrol connection?
~ SWORDFISH is reported as the callsign for one of the CP-140 Aurora Squadrons at CFB Greenwood. This plane is the Canadian version of the U.S. P-3C.
~ The CFARS callsign CIW8125 has been issued for the HMCS Ville de Quebec.

U.S. Navy

U.S. Coast Guard
~ New address for USCGC Valiant as she recently changed homeport from Galveston, Tx: c/o Coast Guard Base, 100 MacArthur Causeway, Miami Beach, FL 33139-5199. I was also able to find out that this address is good for USCGC Escape (WMEC-6): U.S. Naval Station, Charleston, SC 29408-5000.
~ Effective 1 October, the Coast Guard changed the name "Radioman (RM)" to "Telecommunications Specialist (TC)." So now we have a TCIC (Tele-communications Specialist In Charge) in place of the former RMIC.
~ Effective 1 April 1995, the Coast Guard will no longer have anything to do with CW, including HF. This will be the end of an era, and it's kind of sad.
~ USCGC Citrus (WMEC-300), NRPQ, has been decommissioned.

Thanks to Jim Pogue (author Coast Guard Radio and The Warship Directory) for most of the USCG info this month. Jim is considering updated editions on both of those books and is working on several new books these days.

Other information via the Navy News Service (NNS), Air Force News and Steve "Mr. Warship" Schultz.

MARITIME
~ I caught something new in a Sitor-B traffic list from Palo Alto Radio, KFS: CQ CQ DE KFS/WNU/VCT KFS/WNU/VCT
=
HELLO ALL STATIONS. THIS BROADCAST ORIGINATES FROM:
PALO ALTO RADIO KFS (SAN FRANCISCO) - SELCALL 1094
SLIDELL RADIO WNU (NEW ORLEANS) - SELCALL 1109
GRAND BANKS RADIO VCT (NEWFOUNDLAND) - SELCALL 1094
===
NEWS:
WNU ATOR CH.401 NOW OPERATIONAL.
VCT ATOR CH.812 AND CH.1263 NOW OPERATIONAL.
SIGNAL REPORTS WELCOME AND APPRECIATED.
===
FOR ATOR SERVICE USE KFS/WNU/VCT ITU CHNL PAIRS:
401 403 603 627 803 812 819 1203 1219 1257 1263 1647 1657 2203

Whoa...Grand Banks Radio, VCT...? That is correct! A new Sitor station joined the KFS/WNU team from up Canada way. Then the ever alert Mike Hardester heard the CW ID on 8414.0 and fired off several letters. Here is what Mike says he found out:
I received a letter today from Halifax Coast Guard, where each time I have an UNID Canadian, they hear from me and are always (usually) quick to

reply. Regarding my log of VCT, the Acting OIC replied:
"When I first read your letter, I must confess that I had never heard of the radio callsign VCT. To satisfy my own curiosity, I went to the Ops room and tuned in 8422 kHz myself. There was no mistaking the CW ID as VCT. No one on duty that day knew who belonged to the callsign."
He goes on to say he contacted the Dept. of Communications and they identified the operators: Sealink Communications, c\o General Delivery, Torres Cove, NFLD. AOA 4AO. They are a "privately owned company providing radio service to the shipping community." They have MF & HF radiotelephone capabilities, but the OIC said that RTTY was not listed. So, mystery solved.

And a good piece of detective work too! Thanks Mike.

~ Speaking of mysteries, last month Tim Braun reported Caribbean sounding
traffic on 8156. I have since been able to confirm by listening that this is Coral Harbour Radio, C6N55, in the Bahamas. The frequency is not listed for them anywhere. Not surprising as it's just a tad out of band. I've heard them working various pleasure vessels (all flagged in the Bahamas) 0300 to 0600 UTC. Not the 'patrol frequency' Tim thought he had found, but a nice "find" anyway! And maybe even better, cause we can QSL this one!
~ John Cope down Texas way reports finding "BOC Race Control" on 16534.0 USB, using callsign KXE221 working several BOC yachts. The BOC Around the World Alone is a single person around-the-world yacht race. Another good find from the only person I know to have logged a Pakistani naval ship! This was the SMDL3520, ARKE, on 12311.0 working probably Karachi Radio, Pakistan, which operates on that frequency.
~ Last year, the Greenpeace organization was granted a number of HF coast
station frequencies with which to communicate with their fleet of vessels. The frequencies issued by the FCC are reported to have been such that the modulation had to be digital and was limited to a 300 hertz bandwidth. The digital mode thought to be used on these frequencies is Clover, a mode used in amateur radio circles. I'd be very interested if anyone has information on the actual frequencies or the mode used.

AERO
The National Hurricane Center (NHC) flies the famous WP-3C "Hurricane Hunter" aircraft NOAA 42 and NOAA 43. The NHC recently moved into new headquarters at this address: The National Hurricane Center, NOAA/NWS, 1320 S. Dixie Highway -Room 631, Coral Gables, Fl 33146. The old address no longer works. But if you would like to write the aircraft crew, Jim Navary obtained this address: NOAA (aircraft 42 or 43), NOAA Aircraft Operations Center, PO Box 6829, MacDill AFB, FL 33608. Hurricane season ends by November 31 and the 42 and 43 aircrew's have already stood down from missions for this year. Hurricane Gordon was a late one and resulted in several persons being rescued in SAR's by the U.S. Coast Guard. Most notable was the rescue of four persons from the S/V Marie Flower 2 by the HH-60 helo 6034. Due to the time on station to perform the rescues, arrangements were made for 6034 to refuel on board the aircraft carrier USS America. CBS showed footage taken by the helicopter of the rescue.

That's it for this month (and this year-hi!). I hope each and everyone
of you has a joyful holiday season. DE RD

==========
Note: This is the Feb. 'Electronic Edition' and is from the Dec. 1994
SPEEDX member bulletin "Shortwave Radio Today", ISSN 0882-8091.

It is with great sadness I report that Speedx ceased publication
with the January 1995 issue of Shortwave Radio Today. For those interested
in utility stations (SSB or Digital) contact me at ae411@yfn.ysu.edu for
the status in several ute information projects being considered by former
Speedx members at this time. -Rick Baker

>: frequency publications. Thank you.

Police and fire freqs maybe listed under Contra Costa County. San Ramon's police service is provided by the Sheriff's office. While researching for a radio project in Chevron Park I was told by "SRPD" that their radios are controlled by the county. I am not sure about fire - San Ramon Fire District? Daugherty Fire District? (Daugherty's fire jursidiction stradles the Alameda/Contra Costa lines.)

From: dvancao@lochness.uhc.com
Message-ID: <3gji20$pj5@rohcs1.uhc.com>
Source record: 262065

You should consider that the head/ear phones has a freqency range
from 20,000 Hz to 20 Hz. The speaker on the AR8000 does not have
that high and low of a freqency range. That's why you can not
hear the hiss or the low bass on the speaker.

(SNIP)

Maybe you should just turn the antenna upside-down instead of
the whole car. That tends to ruin a paint job pretty quick! =;^)

Privately published law books can be published before the state of
California gets around to it. The information was already published
in the legislative record.

You might find some of these for sale at "uniform" shops, the kind
that sell uniforms for police, fire, postal workers, CDF, etc.;
I did.

Just a quick note that there are lots of the keyboard modifiable Pro-51's available at many Radio Shack stores. The trick is to look at the demo model the store has. I've been in three or four different RS stores and they all have the 7A4 as a demo model. This is how I bought mine and two more for friends.

Source record: 262054

To all those who responded to my last query regarding the Motorola Radius GP-300, thank you. :-)

Some mentioned that with the model number, the correct band area could be determined and thus, searched. It has taken me quite awhile to get the security guard here alone, but today I finally succeeded. After taking off the battery compartment, the model number appears to be:
P94YPC20A2AA

I wrote down many of the other numbers as well just in case.

Would anyone with a model number mapper please let me know where to continue my searching? It would be most appreciated.

~Ken

Indianapolis used to use plain English, but that's the only place I've ever been that did. The codes may speed communications slightly for common calls, but not when the dispatcher has to look up an incident code to say it and the officer has to look up an incident code to decipher it.

NYPD seems to use the word "collar" a lot. I thought that stopped being used about 1920.

>communications.

From the physical description I would agree that they are ASTROs but I haven't been up close an personal with any LAPD eqquipment. The ASTRO is not a SABER. In addition to being encryption capable they are both analog and digital. Any channel (mode) can be nFM analog or digital. "Flashport" programming can allow the digital modes to be as narrow as 6.25 KHz wide if (when) narrow channeling requirements are imposed.

They can be upgraded to comply with what's called the Common Air Interface standard for all digital communications. I believe CAI calls for 12.5 KHz channels.

They are available in VHF, UHF and 800 MHz models (by now 900 is probably available) and can be conventional or trunked.

I tried these things at a trade show last year. The digital technology is very much improved so that voices don't sound so mechanical after the A/D - D/A conversion.

There are ASTRO repeater/base stations and mobiles as well.

Cross-posted to: rec.radio.scanner,alt.radio.scanner

Why is the Icom computer interface, CT-17, so expensive? I've always thought that it is simply a level converter.

There is an article in July 1993 (or maybe 1992) QST that describes the construction of a CT-17 equivalent. This little circuit uses four common transistors and a few diodes, caps, and resistors with a total parts cost of about $4. Why, then, does the Icom CT-17 cost over $100??

>when alkaline cells are installed in the unit... Can anyone verify this?

Connecting an external power source will apply a charging current to the batteries. If they're not designed for recharging (e.g. alkalines) you run the risk of exploding them and leaking caustic electrolyte all over the innards of your expensive new scanner.

For Sale: AR-1500 Wide Range Scanner (an AOR Product)

Coverage: 25 Khz to 1300 Mhz, AM, NFM, WFM (no cellular blockage)

1,000 channels in 10 banks, including auto-store capability.

Includes AC adaptor, cigarette-lighter adaptor, earpiece, two antennas, instructions for AOR's traditional "user friendly" instruction set. ;-) Also includes a carrying case. In original packaging. If you want additional information, I believe I have the review of the unit on-line somewhere, and I can email it to you.

Cost me $597.98 in March 1993 from Scanners Unlimited in San Carlos, CA.

Selling for $400, including Federal Express to the the destination of your choice. Outside the US, you pay the duties/taxes.

1439. PRO-43 Modifications FAQ

Radio Shack PRO-43 Modifications FAQ
CONTENTS

1. Introduction
2. Which units can be modified for extended frequency
reception?
3. Companies that will do the extended frequency modification
for you
4. The modifications
extended receive
keypad beep delete
improved audio
attaching an S-meter
400 memory channels

---

1. Introduction

Because there is a continuing demand for it, this mini-FAQ about PRO-43 modifications will be posted every two weeks until someone tells me to "get rid of it". In large part, it is the file PRO43.MOD from pub/hamradio/mods/tandy at oak.oakland.edu .

The FAQ now includes mods for

(1) extended receive
(2) keypad beep delete
(3) improved audio
(4) attaching an S-meter

There is also a mod for 400 memory channels, but, to quote its author, it is very complicated, should only be attempted by someone with moderate to advanced electronics experience, and is not for the faint of heart or the "weekend technician." A brief description is included at the end of this FAQ. If the mod were included in its entirety, the size of the FAQ would be increased four-fold.

---

2. Which units can be modified for extended frequency reception?

Note: It is against the law (Electronics Communications Privacy Act of 1987, public law 99-508, amended 1994 by public law 103-414) to listen to cellular or cordless telephone communications. However, it is not illegal to own equipment the can receive or can be modified to receive such

communications, even though it became illegal as of April 1994 to manufacture or import equipment that could be easily modified by the user to receive cellular communications. Equipment manufactured before the cutoff date can continue to be sold until stocks are exhausted. While businesses are forbidden from importing cellular capable scanners for resale, the question has been raised whether an individual can legally import such equipment not intended for resale. The issue is not explored here.

Which PRO-43 units can be modified for extended receive?

Modifiable | Nonmodifiable
|
serial number no A in # | begins with A
FCC-ID AA020-300 | AA020-300A

Inside the battery compartment is a paper label containing the date of manufacture in the form "month A year". For example, 5A3 is May, 1993. The cutoff date after which units could no longer be modifiable is April, 1994 (4A4). So far, all units made before 4A4 are modifiable while all units made after 4A4 are not modifiable. There has been a firm report of a nonmodifiable unit with a 4A4 date of manufacture. There may be modifiable units with a 4A4 date of manufacture, but this has not been verified.

There are no software modifications for the PRO-43. It is not possible to extend the frequency range of the radio by pushing buttons from the keypad. Such modifications are possible with other units, such as the PRO-51, but *not* with the PRO-43. The PRO-43, made by GRE (General Radio Electronics) of Japan, is one of Radio Shack's few triple conversion units. Radio Shack units with software modifictations are double conversion units made by Uniden.

Modification procedures for other radios are available by anonymous ftp from the pub/hamradio/mods/<manufacturer> subdirectories at oak.oakland.edu.

In the extended receive modification, there is some debate about whether step (5) is worthwhile. Many report poor reception; others report that the unit is not designed for good low band reception. So, if you trash the diode in step 4 or want to quit while your ahead, don't lose sleep over it.

---

3. Companies that will do the extended frequency modification for you

If you'd rather not do the extended receive modification yourself, you can have it done for you for $40 (including insured UPS return postage) by Cellular Security Group, 106

Western Avenue, Essex, MA 01929 (508/768-7486). However, CSG will not move the diode to extend the low band to 88 MHz; they only remove the diode to unlock the 800 MHz frequencies. When CSG is mentioned on the net, two types of comments follow: testimonials from satisfied customers and comments from those with the technical skills that the service seems high priced for just removing the diode, but there have been *no* reports of shoddy work or damaged radios. (They've modified two of mine.)

Grove Enterprises has begun advertising repair services and will do the mod for $40 plus shipping. When I spoke with them, they said that they will move the diode on units that can benefit from a move (as opposed to just a removal) but they also said that one could only tell if the diode should be moved after looking at the insides. They claimed that one could not tell from a serial number or date of manufacture. For further details, call Grove at 704/837-7081. In order to get your unit modified you must first get a service order number from the same telephone number. Packages without a SO# will be refused.

---

4. The modifications

This file is meant to replace the old PRO-43 mod file. 1/26/94

From: armille@afterlife.ncsc.mil (A. Ray Miller)
Summary: cellular (870-890 MHz) and low band (51-88 MHz) restoration for PRO-43

A few people have mentioned the cellular mod for the PRO-43; it turns out you should not remove but MOVE the diode. Doing so allows cellular coverage as well as low band (up to 88 MHz) coverage.

Acknowledgments to Grove Enterprises; this information came from them. They are selling the PRO-43 for $300 which is $50 less than Radio Shack. I have no connection with them other than as a satisfied customer.

PRO-43
Cellular Frequency Restoration and Low Band Expansion

Note: It is not lawful to monitor cellular or conventional mobile telephone conversations.

The following procedure requires familiarity with microcircuit soldering and will violate your warranty. Grove Enterprises assumes no liability resulting from its attempt, nor will accept the modified scanner for return under any condition.

TOOLS NEEDED: Fine point, low power soldering pencil; solder wick or a desoldering tool; pointed awl, hemostats or pointed tweezers; small Philips screwdriver; solder.

1) Remove the battery, antenna and back cover (held in place by four screws).

2) Remove the six screws holding the top circuit board in place. Carefully unsolder the two antenna connections from the board. Bend the antenna ground tab fully up from the board. Carefully lift the board, unplugging the black connector at its base, and lay the board out of the way on its bundle of colored wires.

3) Remove the two screws from the next board and lift it, carefully unplugging the white connector at the bottom of the board. Lift it up and lay it aside on its brown wire (which can be unplugged if necessary).

4) Unsolder and remove the metal shield from the final board, revealing the microprocessor; note the row of diodes labeled D1-D5 above it. Only diodes D1, D2, and D4 are present; assisted by a pointed tool, unsolder and remove D4, the lone diode (this restores cellular frequencies which will be searched in 30 kHz steps).

5) Resolder the removed diode carefully into position D3 to extend low band coverage to 88 MHz.

6) Reassemble the boards, paying particular attention to the alignment of the plugs. Test the radio by entering any frequency between 870 and 890 MHz (cellular) and 51-88 MHz (low band).

==========

From: ross@novax.llnl.gov
Date: 19 Aug 92 16:51:08 GMT

Here is my keypad beep delete mod for the RPO-43:

1. Remove battery.
2. Remove back cover (4 screws).
3. Remove top board (6 screws, desolder two antenna connections and bend antenna ground lead up out of the way). Be careful of black connector at bottom of board. Flip board over and lay aside (wire connectors need not be disconnected).
4. Remove middle board (remove 2 screws and wire connector). Be careful of two multi-pin connectors along underside of board. Set middle board aside.
5. Locate 10 pin connector on side of bottom board (labeled CN3). Note that one end of connector has pin 10 labeled as such. Count back to pin 6 and bend pin 6 ninety degrees towards the large RF shield. Make sure the bent pin clears the RF shield.
6. Reassemble and your done OR do the cell mod since you are so close.

Have fun. Gary Ross >usual disclaimer>

Subject: Improved audio for the PRO-43 portable scanner
From: parnass@cbnewse.cb.att.com (Bob Parnass, AJ9S)
Date: Wed, 2 Dec 1992 01:15:35 GMT

IMPROVED AUDIO FOR THE PRO-43 SCANNER

by Bob Parnass, AJ9S

The Radio Shack PRO-43 scanner audio is too bassy.1 The lack of treble makes it difficult to hear the PRO-43 in noisy situations, especially while listening in a car or truck. Louis Shirley sent me a schematic and suggested I remove C341, a tiny 0.015 ufd surface mount capacitor.

I'm glad to report that removing C341 made a great improvement. The audio is now much "crisper," more like the Uniden 200xlt, although still not quite as loud. Turning the volume control up still overloads the PRO-43's small, internal speaker, but there's less need to do that once C341 is removed.

The PRO-43 contains 3 printed circuit boards, and the middle (second) board contains the audio circuitry. Finding C341 is difficult, as it is neither marked with a value nor a component designation. It is located on the foil side of the middle board, under IC304, an LM386 amplifier IC. C341 is in parallel with, and physically next to, R350 (33,000 ohm). R350 is slightly larger than C341 and is marked 333. Both R350 and C341 are connected between pin 2 of the LM386 and ground.

A Note About 50-88 MHz Reception

Now that I have a schematic, I see that the European version of the PRO-43 has different coils and capacitors in the low (mid) band front end filter. That explains why the 75 MHz sensitivity isn't stellar after adding diode D3 to enable 30-88 MHz coverage.

---

Subject: S-Meter for PRO-43
From: schuster@panix.com (Michael Schuster)

Found this on the Fidonet scanner echo:

=====begin quoted text=================

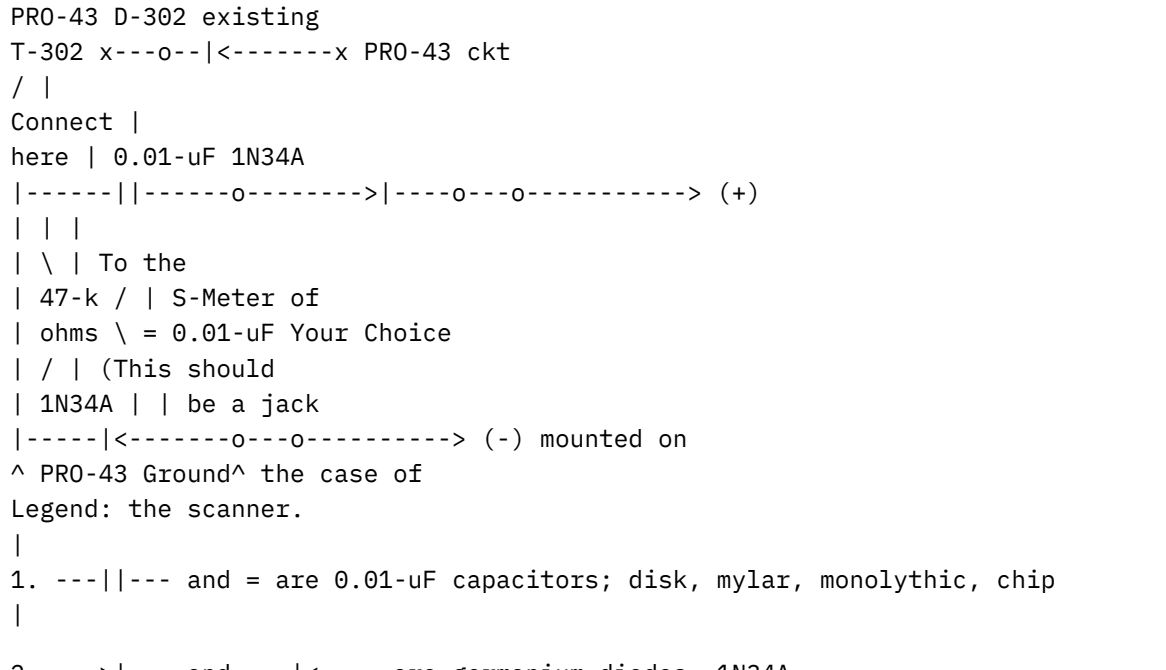
Date: 02-06-93 00:24
From: Bill Cheek
To: All
Subject: PRO-43 S-Meter!

Greetings Scanner Fans!

It had to happen! The fundamentals for an S-Meter exist alive and well in the PRO-43! Only a simple circuit and your choice of meter, analog or LED, is required for a jim-dandy S-Meter function!

The key point in the circuit is the cathode of D-302 located on the bottom (solder side) of the AF Board (middle board). You will need the Service Manual for the PRO-43 to find it as it's not marked and it would take me 10,000 words to guide you to exactly where it is located. Call Tandy National Parts at (800) 442-2425 to order your manual: approx $10. Now here is the deal:

Locate D-302 and either build the following circuit right there on the back of the AF board in the vicinity of D-302, or solder a wire to the cathode of D-302 and route it to somewhere else more convenient to feed the below circuit. This wire ought not to be very long, though, say not more than a couple of inches. Refer to the ASCII schematic diagram as follows:



1. ---||--- and = are 0.01-uF capacitors; disk, mylar, monolythic, chip

2. --->|--- and ---|<---- are germanium diodes, 1N34A
| is cathode
< is anode

3. o means a connection, preferably soldered

4. The 47-k resistor is self-explanatory, I hope.

5. -------- and | are wires/conductors.
|
|

6. x is existing PRO-43 circuitry

If you use an analog meter, preferably a real S-Meter like salvaged from an old junked CB rig, then rig it as follows to connect to the circuit above:

```
5-k Trim Pot
(+) --------/\/\/\/\---o--------|
| | |
This should |-------| |
be a plug of +
some sort to The S-Meter
connect to the Terminals
mating jack on -
the scanner |
|
(-)----------------------------|
```

You can also build the 10-segment LED S-Meter as shown in Volume 2 of my SCANNER MODIFICATION HANDBOOK, available from leading mail order radio dealers everywhere. ISBN 0-939780-14-3 published by CRB Research Books, Inc. Commack, NY.

After connected and working, locate the PRO-43 very near a known strong transmitter, perhaps a ham transmitter, a police cruiser, your favorite security guard's handheld or right next to a cordless telephone, or anything else known to transmit a strong signal. Tune the scanner to the frequency, and adjust the 5-k trim pot above so the meter reads exactly full scale. All other signals will read proportionally lower to yield "relative signal strength" measurements! A hell of a circuit here, boys & girls! Have fun!

Subject: PRO-43 w/400 CHANNELS HERES HOW!

IT IS NOT FOR THE FAINT OF HEART however.

PRO-43 ENHANCEMENT
MEMORY EXPANSION & "FADE-AWAY" LIGHT
Brett Bennett 4/12/94
bbb@kuhub.cc.ukans.edu
Copyright 1994 B&D Electronics All Rights Reserved

INTRODUCTION

The following document details two enhancement modifications that are possible on the Radio Shack PRO-43 scanning radio. The first modification doubles the factory standard memory capacity, allowing you to enjoy an additional 200 channels of memory, plus 10 more monitor memories. After completing the first modification, it is a fairly simple matter to add a 7 to 10 second delay feature to the LCD back-light lamp circuit. I designed and performed these modifications on my PRO-43 and they do work. As I understand it, there (has been/is being) presented in WORLD SCANNER REPORT a similar memory expansion. I have not seen this modification and for all I know it is a better way of doing it. What is presented is a 'clean-room' design of my own that to the best of my knowledge is the only one to also offer a time-delay for the LCD back-light. Having said that, let me say:

I ASSUME NO RESPONSIBILITY FOR ANYTHING THAT MIGHT HAPPEN TO YOUR RADIO SHOULD YOU OR ANYONE ELSE ATTEMPT THESE MODIFICATIONS. WHILE REASONABLE CARE HAS GONE INTO THE PREPARATION OF THE FOLLOWING DOCUMENT, I CAN NOT GUARANTEE THAT THERE ARE NOT ERRORS.

The procedure described below is very complicated, and involves the soldering and desoldering of very tiny components and the cutting of printed circuit board traces. While the procedure is not irreversible, it will leave permanent scars inside your scanner. It should only be attempted by someone with moderate to advanced electronics experience. I don't think it should be attempted by, to quote someone else, a "weekend technician." If as you read through this you feel intimidated by the jargon and required procedures or if an electronic schematic looks like a strange piece of modern art to you, then this might not be the 'mod' you are looking for. The following document will assume you have obtained the materials listed below, especially the Service Manual, and you have studied the circuit in some detail. I will not describe in great detail where every component is or where every solder point on the logic board should be placed. Having the Service Manual, and having studied the drawings therein will allow you determine to where it is I refer.

REQUIREMENTS

1 - PRO-43 Service Manual. (Tandy Parts # MS-2000300 - approx. $6.00)
1 - CD4053 - Triple - SPDT analog switch - Surface mount package (DigiKey #CD4053BCM-ND - approx. $1.50)
2 - 93C67 EEPROMs (Tandy Parts # MX-8050 - approx. $13.00/each)
1 - 100k x 5 resistor network. Common lead type. (DigiKey # Q5104)
1 - UN2111 PNP transistor (Q1 on Logic PCB. Tandy Parts #)
1 - 1 uF 16v capacitor.
1 - 10 MOhm 1/8-1/16W resistor.
Misc.:
Wire wrap wire-30 gauge. (Radio Shack)
Grounded soldering iron with approx. 1/32" tip or smaller.
Desoldering Equipment.
Digital Volt Meter. (Used to double check your VCC and Ground connections, pre-check switching assembly)
Utility knife with fresh sharp small blade. (Needed to cut traces.)
Strong hand held magnifying lens. (Needed to check solder joints.)
+5-10 Volt bench power supply. (Used to check switching assembly.)
Anti-Static work place and grounding wrist band.
Very fine needle nose pliers, wire cutters.

Has anyone else had the problem of their pro43 draining the batteries while the unit is off? I've been messing w/ one that is doing this and it's got me mystified. I haven't figured out exactly how much is being used when it is off, but mildly weak batteries will be dead in 3-4hrs. Is this normal?
Dave

>how good a quality sound can you expect from an SCA broadcast. I seem to
>recall seeing an SCA kit in one of the electronics magazines with stereo
>output. Is that possible?

Possible but not likely. The rules are fairly vague - a stereo FM
station can put any kind of subcarriers it wants between 53 and 99 kHz
(mono FM stations can use 20 - 99 kHz) but the sum of all the subcarriers
and their modulation must be less than 20% of the full 75 kHz deviation
for stereo stations, or 30% for mono stations (and the subcarriers
above 75 kHz must total less than 10% deviation of the main carrier).
Most SCA transmissions are double sideband AM and limited to a few
kHz of bandwidth (5 to 10). See 47 CFR 73.319 (FCC Rules).

>2. Do FM stations ususally broadcast only one SCA program? I.e. is it
>possible/normal for a station to send a program at 67KHz and another one,
>say at 92KHz?

No certain limit. Like a foreign language and background music, or a few
kHz of paging, so long as the total bandwidth and deviation limits
aren't exceeded. The income from SCA's usually doesn't offset the
extra "loudness" that's lost ... competitive stations who spend a lot
on being loud and think that this boosts their ratings tend not to
have SCA's.

As follows:

477.8375 Bronx South
478.2125 Bronx North
478.2625 Brooklyn Central
477.9125 Queens
477.8625 Brooklyn North
478.0125 Citywide -Used for MCIs & by supervisory personnel-

800 MHZ:
854.9875 - Brooklyn South & Richmond (SI) **Not on the trunked sys**
855.9875 - Manhattan North **Not on the trunked system**

856 - 860.9875, 860.7375 - Trunked system with the following channels:
Manhattan Central dispatch, Manhattan South dispatch, 800 mhz
Citywide, Direct channels between all borough dispatchers and
supervisors, Inspectional Services Unit, Telemetry Control, Roadside
Repair, and many others.

All together there are 10 dispatch channels (including Citywide).
The channel with the most activity is probably Queens with well over
50 ambulances operating at any given time on the one channel for that
borough.

your cb radio will do you no good unless your brother is transmitting on a cb. You're no doubt using the scanners supplied 'rubber duck' antenna, which is why your reception is limited. This is normal. If your co-horts are also receiving in 150mhz with elevated antennas, these are probably VHF antennas installed on some sort of mast for increased range.

<cb's operate in 27mhz. The bc 200 does not receive that low...>

Correct, PM is emergency medical.

The only industrial services I know of are:

IB Business
IF Forest products
IM Film and video production
IP Petroleum
IS Special industrial
IT Telephone maintenance
IW Power
IX Manufacturers

No IV listed in part 90. There is an LV in the Land Transportation Service.

Good Luck

>into my scanner is a male BNC.

Yes, you certainly can make a good antenna from just some copper plumbing pipe and fittings. The antenna design is called a J-pole, and if you'll ask for the plans in the rec.radio.amateur.antenna group, someone will Email you the ASCII art, or you can look it up in the ARRL Handbook or Antenna Book (available at many libraries). It's a simple antenna that's 54 inches tall for 2 meters. For the frequency you need to receive, it will be about 51 inches tall.

You can scale the dimensions of any antenna by multiplying the dimensions listed at frequency X by X/Y where Y is the new frequency. Example, a 54 inch element at 144 MHz will be 54*144/152=51.16 inches at a frequency of 152 MHz.

>Second question:
> Once I have a good antenna, could I use a tubular aluminum pool
>brush handle for a mast (~20' long)?

Sure can. If you build the J-pole with a "tail", it can be made to be a slip fit over your brush handle. To do this, use a Tee fitting in place of one of the 90 degree elbows in the J-pole design.

Now you might actually want to build a yagi beam antenna instead. This will have more gain than just a vertical, but you'll have to know what direction to point it. That shouldn't be a problem in your application. You can make a beam from a piece of 2x2 wood and some welding rods for elements. Check out the ARRL Handbook or Antenna Book for plans. Scale

the dimensions as mentioned above for the frequency of interest. Clamp it to your mast with a U-bolt.

Gary

>frequency the bug frequency. Any help is greatly appreciated.

I don't know what a 2000 series is. If it is a 2500XLT then you shouldn't
have any problem in that range. If you mean a 200xlt, then your scanner does
not receive this frequency range and the disply will show "error"

I'm not sure I understand your wireless question, but there are professional
wirless mics in this frequency range and you may find "bugs" in this range too.

> 300 or something... needs to be figured out)... he best way is to plug
> and play and see how you like the results.
>

I recommend one highly! I use a mag mount Radio Shack cell antenna w/adapter
and it works great, 30 - 900 Mhz! Sure, not high gain on 30 - 50 but
at least you wont get overloaded, (except for 800 -900, lots of overload
in the metro-RF saturated are). Plus, it is a nice way to hide the fact you
have a scanner in the car.

BTW, DO NOT use the thru glass variety, it won't work except for 800 - 900
since that's where the coupling mechanism was designed for.

I previously had the scanner priced at $575, but after much adoo- I am offering it at a reasonable price of $500.

I do alot of business on the net, and understand the normal haggling process, and engage in it myself, but I am set in this price.

Well, the R-1 that has the 800-900 blocked is $479.95 + the battery case that holds AA's is $22.95 + the carrying case without external battery is $18.95 + the carrying case for the external battery case is $18.95 and shipping is $6. That is a total of $546.80. Bought locally would subtract the shipping but then include the tax making the total $586.75.

Now since $546 is what anyone can get it for today if they went by mail (and today it is only the blocked models), I would be willing to sell it for $500.

I realize that is only a $46 dollar savings... but again, the radio has been used maybe three times, it has been in it's original box, wrapped in each item's original plastic, sitting on my shelf. If you got it from a vendor, you simply wouldn't know ow it's used except that it has all the channels programmed. I am not exaggerating when I say it's new looking! It has never been dropped, exposed to moisture, extreme temperature, or children. Guarranteed not DOA.

Will send you a color brochure in advance if you wish. Just send me a self addressed stamped envelope:

My Pro-43 will lock onto audio signals from one of my CD players. The audio from the CD can be heard fairly clearly on several frequencies and distances of up to a meter away from the CD player. Even with the audio leads removed and a full metal case for the CD player, there still seems to be a fair amount leakage though the plastic front panel.

No, make five copies and send them to five other people, making sure that
one of them is Craig Shergold.

1475. 380-412 Mhz band

Newsgroup: rec.radio.scanner
Date: 1995-01-31 19:08:50 UTC
From: c570074@mizzou1.missouri.edu
Message-ID: <c570074.17.2F2E8AC1@mizzou1.missouri.edu>
Source record: 261986

Does anyone have any idea on what the 380-412Mhz band is used for? I know that just below this is used by commercial and military aircraft, and just above this is used by some public service and private organizations, but I've never heard of anyone using the above band. But for some reason Radio Shack decided it was a good band to have on some scanners.

Any info is gladly appreciated. Thanks.

1476. ***** ANNOUNCING PC-MONITOR v4.03 PC control of FRG-8800 *****

Newsgroup: rec.radio.scanner
Date: 1995-01-31 19:12:57 UTC
From: scollin@sapphire.win-uk.net
Message-ID: <253@sapphire.win-uk.net>
Source record: 261987
Cross-posted to: rec.radio.scanner,rec.radio.shortwave

A long time ago I wrote commercial DOS software to control the FRG-8800.

PC-MONITOR provides a simple to use text based interface to control a Yaesu FRG-8800 HF communications receiver using an RS-232 connection via the FIF-232C interface (or equivalent).

The project started life as public domain software, flourished and got superceded by other commercial projects. Now I have decided to put one of the commercial versions (v4.03) into the public domain FREE!!!

The program is now available as /pub/ham/rigctrl/monitor.zip at ftp.funet.fi.

The last version of PC-MONITOR, version 5.01, is still available commercially and offers support for other radios and a host of other features. E-mail me for more details.

Enjoy!

I don't think so... Some states have enacted STATE laws that protect
cordless phones from evesdropping, but the Fedral Law (ECPA)
specifially exempts cordless phones from its protection.

Is this another example of mis-information like your calling a
frequency counter a Multimeter?

If factual, what is the name or number of this 'new' fedral law....???

1479. WANTED.... Call logging program for Windows.

The manual makes it pretty clear that the batteries will charge more slowly if you use the scanner while charging.

I think power consumption is about 45mA squelched, so if you subtract that from the current of the adaptor it might give an indication.

Personally I get a bit nervous about charging batteries inside the thing, and find that on the PWR jack that 7.5V is no different for operation than 9V.

Are there any tricks like this for the Pro-39?
Mine has full 800MHz without gaps, but there is the massive 174-380
gap and no AM outside airband.

Do you risk erasing all frequencies doing this?

I want to pick up a good portable scanner before all the modifiable ones are gone. I’m homing in on the Radio Shack PRO 43. Is this the best bang for the buck of the modifiable scanners that are left. Also, why did RS label some PRO 43’s Realistic and some Radio Shack. Which ones are newer? Almost all the PRO 43’s left are display units. I’ve always been leery about display merchandise, but if that’s all there is I have no choice. Any comments welcomed.

THANKS!

Terry

New San Francisco Bay Area Scanner BBS Now On-Line
~~~~~~

San Francisco Bay Area scanner enthusiasts now have a new place to meet electronically to exchange messages, data, frequency lists, equipment information and their views on the scanning hobby.

A new section, devoted entirely to scanning in the Bay Area, has been added to Environet, a long-time San Francisco BBS. The new section provides the following features for scanning enthusiasts:

* SF SCANNER - A local conference for Bay Area scanning enthusiasts

* SCANRADIO - The national Fido echo conference on scanning

* ON-LINE FREQUENCY SEARCH - Search a database of San Francisco radio licensees by frequency, licensee name, call sign or geographic coordinates

* FILES SECTION - Frequency files contributed by the Sysop and by users. Information files on scanner modifications, etc.

* HIGH SPEED ACCESS - All lines are equipped with Hayes 28.8k V.FC modems

* NO CLUBS, NO COST - No club membership is required to participate and there's never a charge to use the system

* NEW USERS WELCOME - Those new to the scanning hobby or new to using a BBS are welcome here

System Access Number: 415-512-9108 8N1 24 Hour Service
~~~~~~

To participate in this new Bay Area scanning section, dial Environet at the number above and log on with your first and last names. You'll provide your own password and be logged on as a new user. To find the Bay Area scanning section, select <C>-Conferences from the Main menu and select <R>-Radio/Scanning Special Interest Area from the Conference menu - and you're there!

Enjoy.

Regards,

Dick Dillman, Sysop

Its capabilities are : police, aircraft, cordless phones & baby
monitors, CB radio (I think; it DOES start at 25 mHz doesn't it?)

If you want portability, that antenna should be ok; for use at home
the cheap ($15) RS discone is a good buy.

Happy listening,

Scott

1495. AR8000 Access Database Updated by Jim Dantin (posted) to my info site

Newsgroup: rec.radio.scanner
Date: 1995-02-01 02:43:03 UTC
From: Victor Healey Ki4je <vhealey@crl.com>
Message-ID: <3gmsfn$26c@nntp.crl.com>
Source record: 262013

Jim Dantin (mailto: jadantin@ndlc.occ.uky.edu) has posted an improved version of Steve Siegel's AR8000 Access database to ftp://ftp.crl.com/users/ro/vhealey/www/ar8000-1.zip .

This database is an expansion of the AR8000 database previously posted by Steve Siegel. Jim has flagrantly stolen Steve's original design and forms as the basis for this version. <grin> He has posted it here for your review and comments.

I downloaded my own copy and have already made some changes (improvements ?) already for my own use.

This database has been posted as a FREEWARE product. If you find a problem, Jim will try to fix it, but don't expect the kind of support you will get from a $$$ product. Jim needs YOUR ideas so he can improve the database. Please write JIM or call (502)926-8333 or post an obervation here for all to read.

Features of Jim's new version:

Separate channel and frequency tables - you can maintain a large frequency list and assign individual frequencies to AR8000 memory channels.

Flexible reporting - this is straight MS Access - play to your heart's content.

All the features of Access - import from other databases, text files, or spreadsheets.

Desirable changes and additions to this project is to have the Access dbase program automatically send data to the serial port that the AR8000 is on and have it reprogram the scanner as the database is changed.

73's
Victor Healey (Ki4je)

AR8000 (The Ultimate Handheld Scanning Receiver) sites are now

Hello people...

I own an AOR8000 scanner and i was wondering what databases people out there use to store their frequencies in?

Ive played with a few programs and i like the look of `Tune-In v1.0' by David Carroll, but Im sure there are many others out there worth a looksee? I would like some windows s/ware if its out there actually...

Do any of these people have internet address's? As every one that i have looked at has no way of contacting them other then Snail mail, or marginly faster (but not much) FidoMail...

What does the s/ware that you can get for the 8000 look like and perform like?

Any opinions appreciated...

I would like to trade my 2 meter ham transceiver for a scanner.
Package includes:

- ICOM 2AT handheld (thumbwheel freq. selection, no memories, plain & simple)
- ICOM BP8 battery pack (800 mAh)
- ICOM BC-16U trickle charger
- several antennas
- belt clip (mounts on radio)

I bought the radio used, and the battery & charger new about 1.5 years ago.
Everything looks and works great.

I am looking for a scanner that comes close to meeting the following:

- covers 50 to 1000 MHz
- handheld preferred, or at least reasonable portable
- large keypad and display, illuminated and suitable for easy mobile use
- good selectivity and sensitivity
- ability to run from 12 VDC. I don't care about AC.
- at least 100 memories

What have you got?

-Drew

I'm looking for non-working Motorola Bravo pagers, or ones that are
similar in size. I'm not wanting those ones with the big display lenses.
I don't care how scratched up, just that the casing is not smashed.

It doesn't even matter if they have digital readouts (LCD's). Thanks.

Thanks.

I have one in pretty good condition (coarse the manually is pretty thrashed). It has been modified for cellular and to increase from 300 to 400 channels. I was actually thinking of selling now that I have my AR8000 but I guess it would depend on the price. Also MI seems kindof far, I guess I can't just bring it over after work can I?

Well Let me know what kind of price you are thinking.

P.S. I'm in Fremont CA (near San Jose).

> ... what is the name or number of this 'new' fedral law....???

Public Law 103-414, signed 25 Oct 94, known as the Digital Telephony Act (popularly refered to as the "FBI Wiretap Bill"). The following text is drawn from the original HR 4922, but should be the same as enacted.

SEC. 5. CORDLESS TELEPHONES.

(a) Definitions._ Section 2510 of title 18, United States Code, is amended_

(1) in paragraph (1) by striking "but such term does not include" and all that follows through "base unit"; and

(2) in paragraph (12) by striking subparagraph (A) and redesignating subparagraphs (B), (C), and (D) as subparagraphs (A), (B), and (C), respectively.

(b) Penalty._ Section 2511 of title 18, United States Code, is amended_

(1) in subsection (4)(b)(i) by inserting "a cordless telephone communication that is transmitted between the cordless telephone handset and the base unit," after "cellular telephone communication,"; and

(2) in subsection (4)(b)(ii) by "inserting a cordless telephone communication that is transmitted between the cordless telephone handset and the base unit," after "cellular telephone communication,".

Message-ID: <950201170605115@informal.com>
Source record: 262022

Can someone tell me if my Radio Shack Pro-46 is modifiable for receiving the full cellular coverage? How about the Military airband in the 200 mhz band? The code on the back of the unit is 10A3 so judging from what I've read already on different posts, this unit does fit into the units that were manufactured before the CPU blockout. Any info will be greatly appreciated.

1506. Re: Newspapers using scanners

Newsgroup: rec.radio.scanner
Date: 1995-02-01 05:12:48 UTC
From: ad225@detroit.freenet.org
Message-ID: <3gn58g$qf9@detroit.freenet.org>
Source record: 261903

The reason we in the news media use the information provided
by spokespeople for public safety agencies over what we may have
heard on the scanner is two-fold:

A. It is illegal to repeat what's on the scanner (and dangerous
to do so without confirmation).

B. It is always considered better to attribute the sources of
information and spokespeople speaking on the record provide that
attribution.

Is the information provided by official sources always accurate?
Of course not! Why?

A. They may have agendas which preclude them from telling all
(i.e. they may be protecting the agency which employs them).

B. They may not know all the information and are just parroting
what they've been told.

C. They may for legal reasons withhold information.

Listening to scanner traffic, however, helps reporters ask
the correct questions which get closer to the truth.

You're right, though, when you suggest that nothing beats
being right on the scene seeing for yourself. Reporters,
especially those of us in broadcasting, strive to do that
as much as possible in order to provide immediate and accurate
eyewitness accounts to our audiences.

Speaking of databases, does anyone use their AOR8000 with some sort of palmtop? I've got an HP100LX, and it has a built-in database application which seems to be a natural for compact on-the-go computer control. As an aside, the low-power cmos cpu doesn't radiate as much RF as the bigger laptop/desktop models do...

I'm working out a db now, so if there's enough interest, I'll post.

SCANNER REPAIR SHOPS

by Bob Parnass, AJ9S

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois (telephone 708-455-5105). Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Owner's Report: Uniden/Bearcat 800XLT Scanner

Bob Parnass, AJ9S

Manufactured in Taiwan, the 800XLT is the first programmable Uniden/Bearcat scanner to cover a portion of the 800 MHz band. Covering 40 channels in 2 banks the 800XLT is specified to receive in the following ranges:

TABLE 1. 800XLT Frequency Coverage

29 - 54 fm
118 - 135.975 am
136 - 174 fm
406 - 512 fm
806 - 912 fm

Only a portion of the new 902-928 MHz ham band is covered.

Differs From Past Models

There are several differences between this scanner and its Bearcat predecessors.

- There is only a single scan/search speed: fast!

- 800XLT channel banks contain 20 channels, not 10 as in previous models. Although we should be thankful for the inclusion of a channel bank feature, doubling the number of channels in a bank is a step backwards.

- Scan delay, channel lockout, and priority enable are indicated by separate, colored LEDs rather than the numeric display, making a colorful light show.

- Both the selectable scan delay and the priority sampling period are 3 seconds vs. 2 seconds in the older scanners. Although a matter of personal preference, I like the 3 second scan delay, but would opt for a 1 or 2 second priority sampling period.

- Despite claims on the 800XLT box to the contrary, a 2 digit channel counter is displayed while scanning, as in the BC350, rather than "rolling zeroes" of the BC210/220/250/300. This is unfortunate, as rolling zeroes make it easier to discern what channels are locked out from scanning without having to step through each one manually.

- The keyboard has a good feel, although quite different from the "chicklet" keyboards on Bearcat 250 and 300 scanners. Keys travel further, with less of a positive click. The 800XLT keyboard is much easier to read, as each key has its function printed right on the keytop, rather than labeled above it on an inlay.

- The 800XLT seems to lack "window detection" circuitry, so the scanner may stop prematurely (off frequency) in the SEARCH mode.

- There is no date of manufacture stamped on the cabinet.

- Mobile DC power cord is optional, but is supplied as standard equipment with other Bearcat scanners.

Inside Appearance Pleasing

The inside of the 800XLT consists of 3 circuit boards:

1. a main receiver board, containing vhf/uhf front ends, IF stages, audio amplifier,

2. a feature board, containing microprocessor and keyboard logic, and

3. an 800 MHz front end board, which uses surface mount components.

The boards appear very neat, and it is obvious that computer aided design and automated component insertion techniques were used. What a welcome change from the chaos inside a hand assembled BC250!

No schematic diagram is furnished. Whereas the identity of many of the ICs in earlier Bearcat scanners was obscured by the use of "house numbers", the ICs in my 800XLT are clearly marked with their original designations (e.g. National LM382). This makes repair easier, as one may obtain parts from several sources rather than being forced to buy from Uniden.

Side-by-Side Performance Comparison

Side-by-side tests were performed, switching a Butternut SC3000 tri-band antenna at 20 feet among 3 scanners: the 800XLT, a new Bearcat 260, and an old Bearcat 300 workhorse. The test equipment used was a pair of human ears, which we all use when scanning.

As the following table shows, the 800XLT was more sensitive on some frequencies, but suffered much more overload from strong signals. This is important if the 800XLT will be used with an outdoor antenna. The 800XLT had fewer annoying birdies than the other models tested.

TABLE 2. Performance of Bearcat 800XLT vs. 260 vs. 300

Band	Bearcat 800XLT	Bearcat 260	Bearcat 300
30-37 MHz	more sensitive weak birdies overloaded by paging, police mobile phones	more sensitive moderate birdies no overload detected	less sensitive moderate birdies no overload detected
37-50 MHz	equally sensitive overloaded by paging, police mobile phones	equally sensitive no overload detected	equally sensitive no overload detected
vhf aircraft	more sensitive	N/A	less sensitive
vhf-hi	slightly more	slightly more	slightly less

	sensitive	sensitive	sensitive
	overloaded	no overload	no overload
	by paging	detected	detected
	heard 162.55 wx		
	on 147.19		
	and elsewhere		
_____	_____	_____	_____
uhf	more	less	less
	sensitive	sensitive	sensitive
	overloaded	no overload	no overload
	by paging	detected	detected
_____	_____	_____	_____

On the 800 MHz band, several police, business and cellular telephone stations were received using the supplied 3" antenna. Clear reception of a repeater used to dispatch Chicago Tribune photographers was possible from 50 miles distant.

The 800XLT audio output is clean and strong, with little synthesizer whine.

Early Problem Fixed: Memory Loss

My 800XLT lost its memory contents when unplugged from 117VAC, even though loaded with a fresh pair of alkaline AA batteries. The problem was traced to a metal contact, installed backwards in the battery holder. Repair required desoldering a red wire, repositioning the contact, then resoldering the wire. No further memory problems have been encountered.

Too Much Hysteresis in Squelch

There is too much "free play" in the stock 800XLT squelch control, the same affliction designed into Radio Shack scanners. The remedy consists of replacing the 860K ohm resistor on pin 14 of the MC3359P IC with a 2.2M ohm resistor.

Not As Selective as Older Bearcats

At -55 dB @ +- 25 KHz, the 800XLT IF selectivity is not as good as the BC350 and BC300, which are rated at -60 dB @ +- 25 KHz. The wider selectivity causes the scanner to stop prematurely in the SEARCH mode, and makes it difficult to determine, for example, if a station is transmitting on 855.0250 as opposed to 855.0125 MHz.

Since the 800XLT tunes in 12.5 KHz steps on the 800 MHz band, the wider selectivity is handy when scanning telephone cell sites, which are on channels spaced on 30 KHz apart.

Overall Evaluation

The 800XLT is the most conventional and easiest to operate of the new 800 MHz-capable scanners. It is plagued neither with the slow scan/search rate of the Regency MX7000, the low audio output of the MX4000, nor the unfriendliness of the Yaesu scanning algorithms.

The 800XLT's tendency to overload on strong signals and awkward squelch action detract from an otherwise good performance.

1517. FCC License Data Sources

Newsgroup: rec.radio.scanner
Date: 1995-02-01 08:00:33 UTC
From: bill@thd.tv.tek.com
Message-ID: <3gnf31$1ek@news.tv.tek.com>
Source record: 261938
Cross-posted to: rec.radio.scanner,rec.radio.info

[last changed 05-Jan-95]

Changes preceeded by "|". Please e-mail corrections and additions to me.

INTRODUCTION

This is a list of FCC license data sources available to scanner hobbyists. The FCC master contains a wealth of data about every non-government license | in the United States (over three million records). Most of the sources | listed contain a subset of this data, although a few contain all or nearly all of it. Government licenses are not administered by the FCC, and the data is not available to the public.

If you are interested in purchasing FCC data, you might want to consider forming a co-op of people in your area to share the cost. As far as I can tell, this is legal since the information is in the public domain. However, the software supplied to view or manipulate the data is usually copyrighted and must be purchased separately by each user.

Prices are rounded to the nearest dollar and include shipping, if known.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the University of Michigan's geographic name server. Run "telnet 141.212.99.9 3000" and enter your zip code. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

GROVE

Grove sells FCC data on CD-ROM and floppy. The CD-ROM covers the entire US and is available with or without mapping support. The mapping version brings up a map with the requested station plotted on it. The regular | version is $103, and the mapping version is $173).

| Floppies are available by state for $43 per state (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155.

MICROFICHE

The Bearcat Radio Club sells the FCC master by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

PERCON

| PerCon sells FCC data on CD-ROM. The Spectrum CD covers the entire US and
| comes with a simple database search program. The US Index CD also covers
| the entire US but comes with much a more powerful database manager.
| Regional CDs cover subsets of the US but provide more detail about each
| license. Finally, the mother of all databases is the seven-CD Frequency
| Set, with data organized by frequency.

| Spectrum costs $37, the US Index is $87, regional CDs are $107 each ($465
| for the complete five-disc set), and the frequency set is $1515. Data is
| updated quarterly (the latest data is from Nov 94). PerCon can be reached
| at 716-386-6015 (voice), 716-386-6013 (fax), or Pergrim@aol.com (email).

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $10 per volume.

RADIOMAP SERVICE

Developed by long-time Usenet contributor Bob Parnass, this service prints an 8.5" X 11" color map of an area with transmitter sites shown. Included are key sheets that list frequencies, callsigns, and licensee names. Ranges of 1/2 to 10 miles are available. The service is currently available for the following states: IL, IN, MI, MS, NY, OH, PA, WI. Additional states are being added. Contact Bob for more information. To print the map, Bob requires the latitude and longitude (or nearest street intersection) of the center location. Maps are $20 each. Write to Bob Parnass at 2350 Douglas Rd, Oswego, IL, 60543, or call him at 708-554-3839 between 6-10 PM central time. Bob asks that you do not send him e-mail regarding this service [probably because his e-mail account is supplied by his daytime employer].

SCANWARE ASSOCIATES

ScanWare Associates sells a PC-based database program called the FCC Frequency Retrieval System V2.x. It comes with FCC data for one state, covering all services and all frequencies. Data is updated approximately every six months (last update was Sep 94).

Cost is $35 for the first state and $20 for each additional state. Updates cost $30 per state. (Add $5 for CA, FL, TX, NY.) Quantity discounts available. Fully working shareware copy downloadable from their BBS at 206-871-4228 (FCC200.ZIP). ScanWare Associates can be reached at 206-698-1383 (voice) or 206-698-8207 (fax).

US SCANNER PUBLICATIONS

Similar in style to Police Call, this series of directories covers ALL radio services between 30 MHz and 2 GHz. Each volume covers one state and costs between $14 and $29, depending on the state. The volume for California is 820 pages. Contact US Scanner publications at 800-890-6999 (voice) or 503-233-5176 (fax).

As long as the phone is desgned to operate on a phone system similar to what is used in the US, then it would work. In other words, the fact that it is cordless is not a factor.

1522. Telescopic aerial

Newsgroup: rec.radio.scanner
Date: 1995-02-01 09:49:38 UTC
From: dpfg@ukc.ac.uk
Message-ID: <6175@rook.ukc.ac.uk>
Source record: 261941

I am using Tandy's 9 section telescopic aerial with the Pro-39, the one that claims to do 25-1300 MHz.

The aerial instructions say that for 30-54, and 108-136 (aircraft) to extend it fully.
For 136-174, the top 4 sections should be extended, thus collapsing the bit jsut above the loading coil.

I inferred from this that when scanning 68-88, the aerial should be fully extended since this lies between 54 and 108. However I discovered by accident that if the bit just above the loading coil is collapsed, reception improves dramatically. There is a marginal difference when collapsing the bottom 3 bits, but this is nothing compared to the other part.

The instructions also say the aerial can transmit between 130-530MHz, and that the bit above the coil must ALWAYS be collapsed to avoid damage, but does not explain why.

I would try to calculate the theoretical length from the formula but I am not sure whether to include the loading coil or the bottom bit which does not collapse, in the calculation.

Is aircraft a special case requiring full extension because of high-flying, AM or lower sensitivity? I find that most planes boom through whatever the state of the aerial.

Does anyone know from experience or expertise the correct position for 68-88? I have always found this band pretty dead in the past; the rubber duck is useless for it, and now I am not sure how to arrange the telescopic.

Thanks...

The portion of the Electronic Communications Protection Act that
used to specifically allow monitoring of cordless telephones was deleted
last October as part of the law requiring the telephone companies to
install equipment to facillitate FBI wiretaps.

Title 18 of the US Code is the federal criminal law.

Here is the relevant section.

Public Law 103-414 signed Oct 25, 1994 (was H.R. 4922)

" SEC. 202. CORDLESS TELEPHONES.
(a) Definitions. - Section 2510 of title 18, United States
Code, is amended -
(1) in paragraph (1), by striking `, but such term does not
include` and all that follows through `base unit`; and
(2) in paragraph (12), by striking subparagraph (A) and
redesignating subparagraphs (B), (C), and (D) as subparagraphs
(A), (B), and (C), respectively.
(b) Penalty. - Section 2511 of title 18, United States Code, is
amended -
(1) in subsection (4)(b)(i) by inserting `a cordless
telephone communication that is transmitted between the
cordless telephone handset and the base unit,` after `cellular
telephone communication,`; and
(2) in subsection (4)(b)(ii) by inserting `a cordless
telephone communication that is transmitted between the
cordless telephone handset and the base unit,` after `cellular
telephone communication,`."

From: Harold G Peach Jr <hpeach@pop.uky.edu>
Message-ID: <3go3ae$atv@service1.uky.edu>
Source record: 261947

Last night while roaming the discount computer stores I noticed an FM radio card for $40 that plugs into an ISA bus and is controlled using MS-Windows software. The box indicats that the radio's audio can also be routed to a sound card.

Has anyone played with one of these FM radio cards? Assuming the bandwidth can be adjusted and the 100 kHz tuning step is not in firmware, it would be relatively simple to create a converter for any 20 MHz section of the spectrum you wanted.

Anyone tried this or have any opinions? For $40 it might be worth experimenting!

This (as you put it) "new" federal law is an amendment to the ECPA that was approved by last year's Congress-critters. I've been up all night hacking on some code, so the exact number of the law escapes me at the moment, but if you absolutely have to have it, and 27 other people don't respond to this message, I'll look it up for you. It is contained in what is refered to as "The Digital Telephony Act". Okay, my last few brain cells just kicked in...check out H.R. 4922 / SB 2375. And after Slick Willie signed it, it became (I think) Public Law 103-414. And Mr. Willie signed it on somewhere around 10/25/94.

From: ptalbot@sccsi.com
Message-ID: <3goeul$k7n@tattoo.sccsi.com>
Source record: 261956

I tried the various keyboard test methods to get the omitted 800Mhz frequencies back on my PRO-51 8A4, here are my observations after pressing 2,9,L/OUT:

The 66-88 Mhz frequencies are now available. Cool.

The 888.96 Mhz frequency that is supposed to be in CH23 is instead 857.2125. Not cool at all. Can't get between 869-896 Mhz.

I notice that 857.2125 is one step above CH22. How nice - NOT!!!

Does anybody know of a way to modify the PRO-51 8A4 to get 869-896Mhz range available? Thanks in advance for the time of the helpful...

I strongly recommend that we standardize on a widely supported (by many
database programs) data FORMAT. I think it is a mistake to standardize
on a program; the data will be valuable long after the program has
become obsolete. It would also be nice if this 'standard' was used by
the wider radio/computer interface community, SWL, hams, etc.

1541. 200-400 MHz and Full Cell on PRO-51?????

Newsgroup: rec.radio.scanner
Date: 1995-02-01 17:55:26 UTC
From: troy@sequent.com
Message-ID: <1995Feb1.175526.26014@sequent.com>
Source record: 261501
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Hi,

The local Radio Shacks have the PRO-51 on sale for $219. I've seen the postings on how to get cellular coverage and I have a few questions before getting one.

o Since there are several breaks in the 800MHz coverage won't the keypad mod (2,9, and moni to get 888.68MHz) only allow coverage in the break that includes the 888MHz? If not how are the other breaks restored?

o Are there other mods for the PRO-51? Is it likely there will be other mods discovered later? I'd like the mods if they are available.

o 200-400MHz (Military) coverage interests me since I'm near an Air Force base. Can the PRO-51 be modified to hit this band? This is an AM band? Can any other handheld be modified to reach it other than the PRO-43 which has it from the factory?

Please post and E-Mail me at the address below.

Thank You,

Troy Wecker

: Was this genuine RF or just circuitry playing games?
The circuitry in the calculator probably created an electromagnetic
field, that created a low-power RF signal. Also could have been the screen.

Depending on the type of equipment, you may want rec.radio.amateur.misc.
Actually, even if it isn't amateur radio equipment, there's probably someone
there who can help you.

I was given a scanner for Christmas and I'm trying to find some
interesting listening. I live near Poughkeepsie, NY. Just
about anything would be great. Such as, police, fire, ems,
news, boats, planes, trains.....

Also, I spend some time in Charlottesville, Va. I'd like to
get some channels there as well.

Thanks in advance.

Soome SCA programming can be heard in the 900 MHz area on a scanner depending on your locality. For instance, three channels of Muzak can be heard in the Minneapolis/St. Paul area (I only remember one of the frequencies though, 959.9625). In Indianapolis, you can hear Associated Press newsfeeds on the 900 MHz band.

From: ac184@FreeNet.Carleton.CA
Message-ID: <D3C8tC.35C@freenet.carleton.ca>
Source record: 261971

I had been having something of a dialogue with tpop@informix.com, and had been looking for a good price on an AR8000. I think I found it: $895 Can. I've been told (by the same dealer, so cum granum salo here) that dealer cost is $880 Can. Do the exchange rate conversion and see if that's a better deal than the prices I've seen mentioned so far. I get the feeling the company isn't very big, and consequently they don't keep AR8000s in stock, so there's a bit of a wait. The scanner is the unblocked version. The employee I dealt with (a nice guy, BTW) is Julio Quinto, the store is Radio Progressive in Montreal, and the number is (514) 336-2423. All usual warnings to those of us in the States who might have trouble importing the unblocked AR8000 apply...

Hope this is useful,

Tim

PSP has been looking into a means to use MDT's compatiable with the NCIC 2000
program in their units. Field tests have been conducted in the Harrisburg area.
More than likely thats what these 800Mhz frequencies are for.

800Mhz would not be a good choice for PA for a statewide system without being
very expensive.

Be aware that Belden 9913 does not tolerate small-radius bends very
well. It uses an air dielectric and sharp bends can cause internal
shorts very easily. It's a great coax for UHF, just make sure you
don't bend it around tight corners.

There are companies that make 9913-equivalent cables that are more
resistent to internal shorts.

Have you looked at Scan*Star? I have tried both ScanCat-Pro and
Scan*Star. IMHO Scan*Star is a polished, professional piece of work,
while ScanCat seems amateurish by comparison.

Scan*Star has a demo version that you can download from their BBS
on 408-258-6462. There are at least two versions: Professional, which
costs about $79, and Commercial, which is about $129.

Off hand that sounds like an absurd price.
email javaiation and ask them for a second quote.
Regarding exchange rates. I planed to post a link
to a server that would return todays exchange rates
in my ar8000 page on the 'and more' side. I can't remember
right now if it is already there or something I have on disk
to do but it should be there in a day or so.

Basically the ar800 should be around $600 USA.

>>VHF or UHF radio? If you used a cellphone, who would hear you and do you
>>think that the owner of a cellsite is going to let you tie up that
>>cellsite playing music or somthing?

What are going to transmit, music? Why would anyone be interested in
listening to it on a narrow band voice channel? I would have no intrest in
the 800 Mhz "music on hold" station. Can you do this as you have suggested?
Yes you can. I wouldn't send your program FROM the cell phone, I would send
it from a regular phone to a cell phone. I wouldn't call it a "radio station".

You are just asking if this can be done, right? You are NOT seriously
thinking about really wasting the effort to do something like this, are you?

BTW: Cell phone, cell sites, cordless phones, two ways, paging
transmitters, whatever are all technically radio stations. I believe you are
asking about starting some type of psuedo-broadcast station.

ID>I've got a Pro 39 handheld scanner which is taken with me in my car. I
ID>have a external aerial on the car but I pick up lots of interference when
ID>I turn my car over. Is there an easy cheap way of getting around this?
ID>It's crystal clear before I start my car, and the interference isn't
ID>always as bad each time.

ID>Any ideas?

ID>Damian

Some interference is picked up through the antenna, and it seems as
though this is your case (if not tapped into the car's power supply). If
you can't find a mechanical/electrical problem ie; bad ground or plug
wire or plug, etc, you may try resistor plugs or filtering on the
Alternator or some other types of filtering. If this doesn't at least
help, you may not be able to elininate it. Most problems are solved with
some of the things mentioned above, particulary if you're tapped in to
the power. Antenna induced problems are a different story.
Hope this helped out.

> Do you know of any Mac databases?

I thought Access was avaiable for the mac.

Can every one work with a tab delimited dbase?
This looks better in html format then a comma delimited one IMHO.
How about RTF?
What should the standard fields be? Then everyone
can make a program to read the standard file
a convert it to what they need.
Come on where are the thinkers who can reason this out completely?

I like the way it is easy to read the ar8000 data. I don't like
the strange way they include far too many zero's in frequency
data which makes that field hard to recognize. I think freq.
data looks best in a 4.5 format with leading zeros suppressed,
following zero/s to no more then five places.

>output. Is that possible?

>2. Do FM stations ususally broadcast only one SCA program? I.e. is it
>possible/normal for a station to send a program at 67KHz and another one,
>say at 92KHz?

I posted a reply earlier - in short, the subcarriers and their modulation
are very narrow but there is no limit to the number of them that a
station could use. I have seen up to three on a stereo FM station,
there can be more. These are subcarriers modulating the main FM carrier
along with the audio, and are also themselves FM modulated -- usually
to a few kHz of deviation (my previous post said the carriers were
AM modulated -- that's true for the left-minus-right stereo subcarrier
but not for the SCA subcarriers).

Here in Greenville, SC, the police (many, not all, I'm sure) have
cellphones. You can occasionally pick up the thread of what's going
down if you are scanning cell range freqs and the police band and
the same time.

Let's not confuse traffic reporting and journalism.
I can understand the use of scanner transmissions for traffic
reporting, though I have friends who are traffic reporters who have been
burned a number of times relaying information from the police band. Most
cities have a centralized control center for traffic operations. A good
station will either have someone stationed in that office during rush
hours, or have a direct line to the dispatchers to collect information.
You must remember that the communication has to go both ways. Cops never
call their base to report "everything's smooth here" so calling the
communications hub, or being there, is important to find out the details
of what is not on the scanner. Road closures for block parties, or ethnic
festivals aren't on the scanner, for example.
>
> I find it strange that the media would trust a spokesperson for an
agancy over the collective >traffic heard from the scene of the incident.
>
Not strange at all. It's not my job to be at war with the police. In
cities like Chicago, or New York there are newsrooms inside the police
stations. The cops need the media as much as we need them. Public
Information Officers provide a vital link in getting the information out.

If I hear a murder on the scanner, I'm not going to report it without
confirmation from the PIO, no matter how many calls I hear. If I'm not
there, all the facts are suspect. This afternoon was a perfect example.
On one of the police channels I heard cops investigating a double
homicide. Instead of jumping on the air with it, I called the PIO. Turns
out, it was a training exercise for the new cops at the state police
academy. Based on what I've heard so far today, they've pulled dozens of
bodies out of this apartment in training exercises. All at neatly timed
intervals. I'm glad I didn't jump the gun and scare the hell out of
230,000 people.

knob-:: The 66-88 Mhz frequencies are now available. Cool.
knob-:
knob-:: The 888.96 Mhz frequency that is supposed to be in CH23 is instead
knob-:: 857.2125. Not cool at all. Can't get between 869-896 Mhz.

Rat Shit finally got it to work (making cell freqs not "easily"
modifiable by the user)!

knob-:
knob-:: I notice that 857.2125 is one step above CH22. How nice - NOT!!!
knob-:
knob-:: Does anybody know of a way to modify the PRO-51 8A4 to get 869-896Mhz
knob-:: range available? Thanks in advance for the time of the helpful...

8A4 is the first date code that is **NOT** modifiable easily
(i.e. no brown wire to cut, no keyboard mods). Take it back and find a
7A4, those are easy to find in most areas, they can take a keyboard mod
(2+9+BAND, then 2+9+L/O).

Of course, you know there isn't much to listen to in the cellular
frequencies...it's illegal anyway! :)

Around here, they say "TX", which means use a phone. As for how they do
it, I pass by a pay phone that almost always has a cop car there. If
my "bird dog" goes off (radar detector) as I pass this pay phone, I just
ignore it because I know they're busy on the phone ;-)

Absurd as in "good" price or absurd as in "you should have gotten the package deal with the Brooklyn Bridge" price? I received the scanner for a total of $971 Canadian, including 7% Provincial Sales Tax and shipping from Montreal to Ottawa. Best deal I could find...

There is no mod for unlocking 800MHz on an 8A4 (at least of the
garden variety that's been discussed here on this newsgroup). I had an
8A4...I took it back and redeemed it for a 7A4 (unlocking 800MHz works
with these).

Greetings -

I know the Pro-43 has been successfully modified, but I picked up a Pro-62 "triple conversion hyperscan", basically because it has a 200-channel scan-range. Has anyone attempted to modify this model? Can it be modded by clipping a diode as with the Pro-51 model? Can anyone outline the differences between the Pro-51 and Pro-62 on the circuitry level? Any information is appreciated. Thanks -

Scott

Yes, that's what I posted earlier, incorrectly. The stereo subcarrier
is indeed DSBSC. But SCA's are FM.

```
======================================================================
\\\\\ The WORLDWIDE UTE NEWS Club /////
\\\ An Electronic Club Dealing Exclusively in Utility Stations ///
\\\\ /////
======================================================================
```

Hello everyone!

With Speedx ceasing publication this month, several of the members efforts went into a replacement so there would be a continuing source of utility information, QSL's and logs.

After discussions with many of you via e-mail (many were non-Speedx members, or members of other SWL clubs worldwide) The WORLDWIDE UTILITY NEWS Club...or WUN (Like we're #1), was born.

WUN will be unique in that it will be the first dedicated 'utility station' club and the first electronic club with an electronic newsletter. "Members" join by simply sending their e-mail address to me, as I have agreed to continue to edit the newsletter as I did in the past with the Speedx electronic edition. There are no club dues. However, those without computer/internet access must pay the cost of printing and mailing. Tim Braun (dpht10d@prodigy.com) has volunteered to publish the paper edition. More information as to cost and a mailing address will be announced.

What else is required of you? Nothing really. I would sure hope WUN is supported by members sending their utility logs (SSB or digital), utility station QSL's and info, news and information along. A February edition is planned, so we need some data as soon as possible! I'm not real concerned as to format, but logs should include the frequency, callsign/station ID, UTC time, mode, and any remarks as to what was logged. We can also use an "alias" for those not wishing their real names used.

From input we have received, the columns will be:
a. International Civil Aero
b. Maritime
c. Military
d. Other SSB News and Unidentified's (non-aero, non-maritime, non-military)
e. Digital News & Info
f. Logs
g. New products, and reviews
h. QSL's -received and info

This may change more or less depending on member input.

Any questions, information, or to join, please contact me at
ae411@yfn.ysu.edu

1599. Standardized data files for computer controled radios

Newsgroup: rec.radio.scanner
Date: 1995-02-02 09:53:37 UTC
From: "Victor Healey (ki4je)" <vhealey@crl.com>
Message-ID: <3gqa31$i6g@nntp.crl.com>
Source record: 262029
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.shortwave

From email and other posting it appears that it is a worng idea to
standardize on a program like Microsoft Access. No matter how good
it is, someone out there could not use it.

Therefore what information should be posted in comma or tab delimited
fields that each ones own database program coiuld rapidly read and use.

My intial suggestion are these fields

frequency in MHZ format, mode, step for band, 7 character tag identifying freq,

line of text describing freq (80 characters max (?), location of transmitter
(city, county,state, country) or latitude and longitude
time of day UTC to switch to this freq,, time of day in UTC freq ends

Therefore a freq file posted for ready use would have a certain
format that could be read by control program or and dbase manager
that would automatically expect these fields in this order.

Please post what you think is necessary and why or emailto:vhealey@crl.com
you thoughts. Please provide examples of reulting field so I can
test it with the html form of posting information for all.
At least 10 or 20 lines would be sufficent.From there others cna
test grabing the data and importing it directly into there programs.

Remember I am looking for data people can read easily and yet
could be easily converted to a format the AR8000 or other
programable reciever can read without much effort.

My interest is of course the wide range ar8000. Yet to be
of max benefit to all a standardized posting of frequencies
needs to allow for the abilities of the other types of
computer controled radios (whether they are a subset or superset
of the ones you have in the ar8000).

Are comma delimited files best or tab delimited for posting to the Net?
Or should some other delimiter be used?

Try these freqs out in your new scanner:

453.90 Dutchess County Fire Dispatch
121.00 Stewart Airport
124.00 Dutchess County Airport
153.08 IBM
146.97 Mt. Beacon ARC repeater
453.40 Downstate Corr Facility
151.34 Dutchess County Sherrif
155.37 Interagency (MRD)
155.535 State Police Troop K barracks
161.700 WPDH music Box
156.045 Mid Hudson Bridge
463,625 Culinary Institue of America
48.06 Central Hudson
48.24 Central Hudson

Town and city of Poughkeepsie have migrated to a trunked system.
Frequencys used by this system are:
860.712 853.262 863.262 863.25625 552.6875 862.6875 854.4125

Lafayette, Olson and Heathkit ... names from the past. Thank you for the
memories Steve ....
Thanks for your response to MPD freqs. I'll get them sooner or later.
At the present time, the old freqs. are still being used. But they are
gradually equipping patrol cars with new radios and cell phones, etc.

Indianapolis is part of a trunked 800 mhz system called MECA. MECA stands for the Metropolitan Emergency Communications Agency. This is a trunked system with well over 35 channels and numerous agencies including the PDs & FDs from the area surrounding Indianapolis. Not to mention all the different channels for the Indy PD.

I do not have the frequencies but they can be found in Monitor America.

I might add that is very difficult and annoying to listen to communications on this system since there are so many different agencies and the channels are constantly changing.

|

| Hi -- Actually I am not a BC101 user. The program is written in BASIC and
| is quite brief. I wrote it for a fellow who has a BC101 that he is
| sentimentally attached to. It was his first scanner, and it still works
| well. Looking up switch settings is very tedious, and some frequencies are
| not even in the list. He is using it with an 800MHz converter to listen
| to the local trunked system, and the converted frequencies are not in the
| book. It works well for this purpose, and 16 channels is adequate.
|
| Since the program is short, I might as well include it with this message,
| so here it is:
|
| ------------------------------
|
```

Trust the serial and FCC-ID numbers. I've modified the FAQ to make the date of manufacture (and also the Realistic/Radio Shack brand name variants) an open question.

I suggest one of two options:

1) Put the keyword "UK" in the subject lines of messages on alt.radio.scanner and rec.radio.scanner (you did know there was a rec.radio.scanner, right?)

2) Get uk.radio.scanner created instead.

Title says it all...

I will be in Indianapolis next week. Can someone please email me
Indianapolis Police and Fire frequencies? I'll be downtown.

I can reciprocate with Cleveland area frequencies if you wish.

Thanks a lot.

Mike

1611. FS: GRE Superconverter (800-900 Mhz Downconverter)

Newsgroup: rec.radio.scanner
Date: 1995-02-02 15:12:53 UTC
From: Harrington.Ed@mail.ndhm.gtegsc.com
Message-ID: <Harrington.Ed-0202951013520001@157.176.66.37>
Source record: 261777

I have a new (in the box) GRE Superconverter. This is a small 2 inch module that attaches to the BNC antenna connector and downconverts the 800-900 Mhz band to 400-500 Mhz band.

I will ship this unit in its original box with manual for $75.

If you are interested, you can contact me via E-Mail or call me directly at 508-880-4292.

Thanks and 73s,

Ed--AA1IN

It would work great on 800MHz, ok on 450MHz, and only so-so on VHF.

In Britain, it is illegal to listen to these things. The penalties
are rather large and/or long. Of course, such a crime is virtually
undetectable unless the perpetrator is either seen doing it, or in some
other way reveals that he has done it, perhaps by posting it on a public
forum ?

One police force used a spoof message (a flying saucer report!) over
its radio system, then sat back and arrested all the scanner toting
fools who turned up at the reported location :-)

Radio users are fast turning to encrypted systems for anything
of any importance, so, if you do try listening, it will likely prove
boring or indecipherable.

Cheers
David

>the 8A4 units, however. The 66-88 Mhz range woke up though.
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

My comparisons of my pro51 next to my Yupiteru MVT7100 show that although
this 66-88 band appears on the pro51, it is not very useable due to the
RF alignment. 66-72 isn't too bad but 72 on up is almost deaf.

In article <D35q0A.5Lo@cix.compulink.co.uk>,
"Hugo Cornwall" (hcorn@cix.compulink.co.uk) writes:

PS>UK cordless phones will work in the USA, provided you aren't
PS>concerned about local regulations and you take some precautions:
PS>
PS>1 UK line voltage is 240 volts 50Hz AC as opposed to the
PS>USA 115 volts 60Hz AC. The difference in AC frequency isn't
PS>significant for this purpose but the voltage is - you will need
PS>a transformer
PS>
PS>2 UK phone plugs/sockets are different from the US
PS>RJ-series. You will need to replace - it's not that difficult.
PS>
PS>3 The UK frequencies are different from the US - at 47MHz
PS>and approx 1800 KHz. You need to establish that 47 MHz is not in
PS>use in your locality for something else - TV perhaps?

The exact frequencies used are as follows:

Channel # Handset Tx (MHz) Base Tx (MHz) Mode

1-8 47.45625-47.54375 1.642-1.782 NFM

You may wish to check them out in your area :-)

These phones use the old CT1 spec analogue system.
Other cordles telephone allocations are at 865.05MHz - 867.95MHz.
30 channels WFM, but I'm not sure of the Base/Handset split, and
finally (I think), the following:

Channel # Handset Tx (MHz) Base Tx (MHz) Mode

1-79 914.0125-914.9875 959.9875-959-9875 NFM

PS>
PS>4 Although prices have dropped, UK cordless phones tend to
PS>be more expensive than the US equivalents.

CT1s appear from time to time at garage sales etc. very cheaply.

New, British Telecom's cheapest offer seems to be about UKP 68.00
excluding tax and shipping. I have seen them cheaper, but I can't
remember where.

Hope this helps.

Julian.

In a previous posting, Randy DeForest (dooman@ix.netcom.com) writes:
> Is it against the law to sell a scanner that has been modified to
> receive cellullar transmissions?

The April 26, 1994 Ammendment to the 1986 ECPA makes it illegal to sell
scanners that can recieve or be modified to recieve cell transmissions.
It is however not illegal to possess a scanner that can recieve cell,
but it is illegal to listen to cell (amongst other stuff, like pagers)
Must have been written by Lawyers!!!

In article <D2ywoJ.IIr@iglou.com>
phantasy@iglou.iglou.com (David A. Adams) writes:

>Anyone know of the headsets in use at fast food locations (McD's, Taco
>Bell, KFC, etc.) use any type of PL tone encode/decode?

I would say scan somewhere from 150-160 very close to the place you want
to find the frequency for.. Perhaps do a scan while you can see someone
is at the drive through speaker..

Once you find out the frequency they use (usually the headsets have input/
output on the same frequency and the drive through -> headset is in the
30-40MHz range). This means it's easy to pick up both, just gotta know
where to look. Then just turn on PL tone decode on your radio and tune
the tones until you hear the person talking. Usually there is one for the
inside comms and one for outside.

Here's a couple places I know..

154.515 218.1 Arbys, inside only
154.515 162.2 Arbys, inside and outside
33.150 ???.? Goes with above Arbys
154.540 123.0 Inside 318 Arbys
154.540 88.5 Inside and Outside 318 Arbys
33.400 ???.? Goes with above Arbys.

154.600 141.3 McDonalds inside
154.600 107.2 McDonalds ouside

As you can see, different stores might use different frequency/tones.
Three McD's in this area use 154.6000 (green dot business freq), but
different PL tones. One even has some odd tone setup that I can NOT
figure out...

Anyway.. Have fun listening... McD's workers are rude, you'll just
get irritated... Isn't it bad enough to listen to 'em when you're
ordering? (In case you're wondering, I work at Arby's so it took me
5 minutes at each store to figure out the PL tones from the headsets
there, and got REALLY bored one day and figured out the McDs across the
parking lot..)

>: the taxi driver's mobile radio?
>
>It would help if you said where you listen VHF ? UHF ?
>
>if vhf 152.??? look around 157.470-158.700

No. Not in the UK.

152.0000 - 152.9875 is police (England and SW Scotland) and fire
service (Scotland). 12.5 kHz spacing. Mobiles are DOWN 9.0 MHz.

>
>if uhf 451.700-452.175 look around up about 5 mgs 456-457 MHz

450.000 - 452.975 fire police and prison service (England and
Wales). 25 kHz spacing. Mobiles are UP 14.0 MHz.

I'd suggest 165.0125 - 168.2375, 12.5 kHz spacing, mobiles UP 4.8
MHz.

But of course this is a purely academic discussion, isn't it, as
we're not allowed to listen to them, are we. So we don't, do we?
No sir! we do not. Ever.

Regards,
Julian.

1626. IMPEDENCE MISMATCH: NEED INFO

Newsgroup: rec.radio.scanner
Date: 1995-02-02 18:36:09 UTC
From: johnnie.martinez@hyperion.lanl.gov
Message-ID: <3gr8mp$3ev@newshost.lanl.gov>
Source record: 261789

I have a really nice Motorola mobile speaker that I'd like to connect to a RS PRO-2026 in my automobile. The potential problem is that the speaker is rated at 2 ohms impedence and the radio is rated at 8-ohms-output impedence.

Is this going to cause any problems for either the radio or the speaker? I've noticed that it's fairly common to connect 4-ohm-impedence speakers to 8-ohm-output impedence radios, but this particular mismatch is making me nervous.

Thanks in advance for any help. By the way, this is my first posting to the newsgroup. I hope it works . . .

Read it more carefully. You can send those scanners through the mail
IF you are a cellular service provider or an agent of the government, which
primarily means law enforcement officer in context of the rest of the law.

NO, NO, NO! It is NOT illegal for someone to sell a moded or modifiable scanner!! Radio Shaq still sells PRO-2006's. It's illegal to manufacture them.

1636. PRO 2006 vs 2035

Newsgroup: rec.radio.scanner
Date: 1995-02-02 23:54:45 UTC
From: milliron@ix.netcom.com
Message-ID: <3grrc5$t3b@ixnews3.ix.netcom.com>
Source record: 261800

Does anyone have any comments or opinions about the PRO 2006 vs the PRO 2035 (not counting the mods available for the 2006). I am tying to find out if there any any new features for the 2035 or if it is just a reworked, non-modifiable 2006 clone.

1637. News In The World Of The AR8000 Scanner

Newsgroup: rec.radio.scanner
Date: 1995-02-03 00:11:38 UTC
From: "Victor Healey (ki4je)" <vhealey@crl.com>
Message-ID: <3grsbq$el1@nntp.crl.com>
Source record: 261747
Cross-posted to: rec.radio.scanner,alt.radio.scanner

If you plan to get rid of your AR8000 now is the time to do so. There seems to be even more interest developing in this scanner then before. Marvin Moss an acquaintance with Lockheed Corp. periodically mails me information that he believes would be of interest.
This week he mailed me a review from the RCSA Journal and it was a positive piece on this incredible radio. He called an left a mesage on my answering machine that there was a piece in Popular Comunications, but neither of us though the review would justify a postage stamp for me to read much less my going out of my way to buy a copy. He said it was positive also.
Today I got the grand daddy of all positive reviews from Marvin taken from U.S. Scanner news, january 1995. It is entiled "A New Concept in Scanners - The AR-8000 Has Them All Beat"
The article starts...

"The AR8000 is the first of a new breed of scanner- or we hope it is - and not just one of a kind. Since this is sort of a preview and not meant to give a detailed review of the scanner (we will do that in the next issue of USSN), we are going to summarize sections of the owner's manual. While I am on the subject of the owner's manual- it is by far- and then some, the best manual ever printed for any scanner! There are 115 pages packed with detailed information, printed in easy-to-understand format. There are none of the translating errors that you find in most manuals from Japan. The owners manual is the first indication that you are about to have an out-of-the-ordinary experience in the world of scanning.

I should say here that I had the scanner for one week before it was sent off to one of our reviewers. I have used many handheld scanners over the years and I can say in full confidence that the AR8000 is by far the best I have ever used. As a matter of fact, it will rival the performance of any base, mobile, or portable scanner on the market, now or in the past."... and so it continues for twenty four more paragraphs and a half page of specifications in an accompaning table.

I have tried the little cellular phone holder and generally found it to be a pain in the neck in many vehicles. It works but it tends to get in the way of either the steering wheel, wiper controls or whatever. I finally took it apart and made it smaller and left it in my Toyota Corolla which I use to commute to work in. I have to read the display through part of the steering wheel but it seems OK with the

AR8000. It is too insecure to handle my much heavier handy talkie.

I found an fantastic buy for an external antenna from MFJ for mobile use. Ham Radio Outlet was selling these magnetic mount antennas with the cellular look that is a 1/4 wave on 2 meters and 5/8 on 70 cm. That means it has 3 dB gain around 440 - 460 MHz. The antenna is painted black and looks very nice on a white surface. The cost for this is a mere $14.95 complete and they even include an SO239 to BNC connector which you will need to attach the coax to the scanner. I bought several. At that price I can afford to have a few stolen now and then! For comparison another mag mount antenna I own cost well over $100 complete.

Just dug them up, there are five of them, and they are 49.830, 49.845,
49.860, 49.875 and 49.890 MHz. You may also find a cordless phone or
two, since these are five of the ten used for handset to base on them.

Hope this helps.

1643. Can the newer Pro-2030's be modified for cellular?

Newsgroup: rec.radio.scanner
Date: 1995-02-03 02:35:29 UTC
From: knight@crash.cts.com
Message-ID: <D3EKJ8.73v@crash.cts.com>
Source record: 261806

I was just wondering: Is it possible to modify the newer Pro 2030 scanners so it can get cellular? I saw this ad in Popular Communications and hey had this place that will do it for you for $40. The Pro 2030 (which I have) was listed as one of the ones they can modify. But does that include the newer ones like mine? I hope it does...even if it didnt, it seems like $40 would be a ripoff for even modifying the older ones since all u have to do is cut that one jumper. Anyway..if anyone one can answer my question...thanks!

There was one at one time, at least 10 or 12 years ago. It connected to
a Commodore 64 and used the computer to keep track of the frequencies.
Beyond this, I don't remember much, such as model name or designation, but
maybe this will jog someone's memory. There are sure to be some C-64s out
and about, if you are luck enough to track down this scanner.

======================================================================
\\\\\ The WORLDWIDE UTE NEWS Club /////
\\\ An Electronic Club Dealing Exclusively in Utility Stations ///
\\\\ /////
======================================================================
```

Hello everyone!

With Speedx ceasing publication this month, several of the members efforts went into a replacement so there would be a continuing source of utility information, QSL's and logs.

After discussions with many of you via e-mail (many were non-Speedx members, or members of other SWL clubs worldwide) The WORLDWIDE UTILITY NEWS Club...or WUN (Like we're #1), was born.

WUN will be unique in that it will be the first dedicated 'utility station' club and the first electronic club with an electronic newsletter. "Members" join by simply sending their e-mail address to me, as I have agreed to continue to edit the newsletter as I did in the past with the Speedx electronic edition. There are no club dues. However, those without computer/internet access must pay the cost of printing and mailing. Tim Braun (dpht10d@prodigy.com) has volunteered to publish the paper edition. More information as to cost and a mailing address will be announced.

What else is required of you? Nothing really. I would sure hope WUN is supported by members sending their utility logs (SSB or digital), utility station QSL's and info, news and information along. A February edition is planned, so we need some data as soon as possible! I'm not real concerned as to format, but logs should include the frequency, callsign/station ID, UTC time, mode, and any remarks as to what was logged. We can also use an "alias" for those not wishing their real names used.

From input we have received, the columns will be:
a. International Civil Aero
b. Maritime
c. Military
d. Other SSB News and Unidentified's (non-aero, non-maritime, non-military)
e. Digital News & Info
f. Logs
g. New products, and reviews
h. QSL's -received and info

This may change more or less depending on member input.

Any questions, information, or to join, please contact me at
ae411@yfn.ysu.edu

1655. Define "scanner"

Newsgroup: rec.radio.scanner
Date: 1995-02-03 08:27:17 UTC
From: kevin.jessup@mail.mei.com
Message-ID: <kevin.jessup.306.001E27F7@mail.mei.com>
Source record: 261147

In article <3gtaqi$6pba@usenetp1.news.prodigy.com> SXSK28A@prodigy.com (Hugh Holt) writes:

>The section you quoted does not exempt private individuals from the ECPA.
> It applies only to government employees acting on behalf of the
>government or to commercial communication services.

>So based on this section, it would be unwise to jump to the conclusion
>that a private individual selling a modified, cellular capable scanner
>through the mail has no problem with the ECPA. However, as a practical
>matter the risk of prosecution may be low. But there is a difference
>between NO risk and low risk.

So just HOW do all these unenforceable laws define "scanner" or
"scanning receiver"?

I can get into test mode on my Motorola cellular flip phone
and receive other channels too. It doesn't actually scan,
but it will let you enter a cellular channel number, which
can then be monitored. Is my cellular phone ITSELF illegal?

Is my $10,000 IFR spectrum analyser (which will demodulate anything
and receives cellular just fine) illegal? ;-) Can I mail it? ;-))

Don't ya just love Big Brother??

1656. WANTED: antenna for CB and scanner; scanner

Newsgroup: rec.radio.scanner
Date: 1995-02-03 08:42:17 UTC
From: cameltoe@ripco.com
Message-ID: <D3F1II.Ex9@rci.ripco.com>
Source record: 261554
Cross-posted to: alt.radio.scanner,rec.radio.cb,rec.radio.scanner

I am looking for 3 things:
1- if possible, an all frequency antenna that would allow me to recieve CB, AM/FM, and ALL scanner frequencies. I would also like to transmit CB with this antenna. Is there such a thing for a car? If not, is there an antenna that would recieve all of the above frequencies, and a second one (presumably a CB antenna) that I would use to transmit. Additionally (I know that this is asking a lot), could this be screwed onto a bolt - where my current car am/fm radio antenna is attached - this is for a '94 Pontiac Firebird.
2- A good quality CB. Something small would be nice since I have very little room to mount this in.
3- A very good quality scanner - preferably something that has continuous coverage - no blocked frequencies (yes, even cellular if possible). I am also curious if anyone makes a scanner that can be mounted in the hatch of my car, with only the control plate needing to be mouted on my dash somewhere - as I said I have very little space to mount anything in my dash.
If anyone has any information please reply to this message, or if possible PLEASE reply via email.
Thank you...

1657. Gold Coast Fire Net

Newsgroup: rec.radio.scanner
Date: 1995-02-03 08:47:55 UTC
From: bsherman@sefl.satelnet.org
Message-ID: <3gsqjr$b0q@sefl.satelnet.org>
Source record: 261819

Gold Coast Fire Net - A fire notification system
305-944-2111 - - - Internet: bsherman@satelnet.org

Instant notification of all working fires around South Florida.

Notification of major incidents from our affiliates in Atlanta, Boston,
Denver, Detroit, Hartford, Los Angeles, New Jersey, New York, Phoenix, Tampa, Virginia and
Washington DC.

Gold Coast Fire Net (GCFN) gathers information from many sources including
media services, scanner listeners, and firefighters. The information is then
dispatched to everyone on the network within moments of its receipt and confirmation.

You get Alpha Numeric messages delivered right to your Motorola Advisor
pager from the net, as well as being able to receive personal pages on
the same pager.

We are always looking for more dispatchers, so if you are interested
in being one, we would like to hear from you.

If you are interested in fire related events, or like to keep on top of
what's going on in your area long before you see it on TV or hear it
on the news, contact us for complete information.

Contact Bob Sherman at 305-944-2111 (a Miami number) or via the internet
at bsherman@satelnet.org.

1658. Summary of Pro-51/Pro-62 question

Newsgroup: rec.radio.scanner
Date: 1995-02-03 08:49:32 UTC
From: topaz@cc.lut.fi
Message-ID: <D3F1uL.FGG@lut.fi>
Source record: 261818

Hello!

Here is a summary of the replies I've received for my question on
RS Pro-51/Pro-62 differencies and user experiences:

> I've been considering buying a scanner. Originally I was looking for
> the Pro-43, but as it is, obtaining one is not so easy any more.
> It is also a bit old, so I figured I might as well go for the new models.
>
> I found a couple of interesting ones from the '95 RS catalog: PRO-51 and
> PRO-62. They are both about the same price, have pretty much the same
> frequency ranges and include about the same features. Since RF interference
> shouldn't be too much of a problem I might take the extra speed of 51
> instead of the triple conversion of 62. But the question is:
>
> Are these radios in other respects about the same?
>
> I know that 51 uses 4 batteries compared to 62. Do they last about as long
> or do I get more with extra batteries (couple of hours more, better sound,
> better lights, better reception, etc)? What else should I consider?

- both models have been on sale at RS for about $219
- usually the changes have been from 51 -> 62 -> 43
- Pro-51 may skip some weak signals because of faster scanning rate
- somebody has experienced "too much TV image interference in the
800Mhz band from signals in the 500-700 Mhz range" using Pro-51
- scanning speed has not been a deciding factor for people
- with Pro-51 it is possible to get cellular (with proper date code)
as it is with older Pro-43s
- "the squelch noise was very noticeable on the 51" (compared to 62)
- in some respects the Pro-62 should be better than Pro-43
(intermod rejection, scanning rate)
- Pro-43 still seems to be The Choice (if available)

Thank you for all those who responded. Your information has been very
valuable to me! Personally I chose the Pro-62 for the following reasons:

- didn't need the cellular band
- scanning speed didn't seem to be as important as i thought
- didn't miss the bands missing from Pro-62 (compared to Pro-43)
- Pro-43 is harder to get & more expensive than Pro-62, but in
other respects quite similar
- $219 for Pro-62 was a good deal

Thank you,

Arto Selonen

HAs anyone tried something called "The VHF/UHF Scanning Frequency Guide"
or a name close to that? I think it has a radio telescope pictured on
the front.
HOw does it compare to the UK Scanning Directory?

THanks.....

I kept hearing this weird RF noise on several channels on my scanner, but
could never figure out what it was since it would come and go at random
intervals. The other night as I put the cordless phone back on the base
(charger) it started this pulsing noise on my scanner. When I took it off,
the noise stopped. Problem solved. The phone must have some chip that
controls the charging.

The VHF/UHF Scanning Frequency Guide is no way comparable to
the UK Scanning Directory.

The latest edition of UK Scan Dir edition 4 has over 20000
frequencies listed, and is very accurate, It's compiled by a
company in Scotland, Interproducts, from lists sent in by
scanner users.

I can reccomend it highly.

It's that good, they tried to BAN IT!!!

The section you quoted does not exempt private individuals from the ECPA. It applies only to government employees acting on behalf of the government or to commercial communication services.

So based on this section, it would be unwise to jump to the conclusion that a private individual selling a modified, cellular capable scanner through the mail has no problem with the ECPA. However, as a practical matter the risk of prosecution may be low. But there is a difference between NO risk and low risk.

If it was for a business, and the scanners were being sold as new. it would be illegal. It is not illegal to sell a used modified scanner.

I have for sale a Radio Shack PRO-2022, which is a 200-channel base/mobile scanner. The cellular band has been unlocked. This unit sold for $299.99 at Radio Shack just a few months ago---with cellular locked.

I will ship it to your door for $150--HALF PRICE. I will ship it in its original box with antenna, owners manual, and 9V memory back-up battery. The unit is in excellent shape and working condition. I have upgraded to a more expensive model and no longer need this unit.

You can reach me via E-Mail or by calling me directly at 508-880-4292.

Thanks and 73s,

Ed--AA1IN

1670. Pro-46 Successful Mod.

Newsgroup: rec.radio.scanner
Date: 1995-02-03 16:42:42 UTC
From: richard.baxter@informal.com
Message-ID: <950204044453301@informal.com>
Source record: 261729

Thanks to several postings, I successfully modified my Pro-46 receiver using the keyboard modification. The cellular band was found on #23 for my purposes (the 888.??? mhz) and it was fairly simple to do. However, a word to the wise, once the keys were pressed,(2,9, L/O) it immediately cancelled out all of the memory that was on there. So be aware to record your current frequencies before you do any modification work.

Question? What's the frequency Kenneth.....(R.E.M.)

1672. Re: Bearcat 101 directions needed

Newsgroup: rec.radio.scanner
Date: 1995-02-03 18:51:59 UTC
From: cab@col.hp.com
Message-ID: <3gtu0f$ll1@nonews.col.hp.com>
Source record: 261555
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Intersetingly, I just sent a non-program description of the same thing to someone (probably the same person) yesterday, and I still have the info on hand. The BASIC program Bob cites is *wrong* in at least one area:

```
: 320 IF F=>30 AND F=<50 THEN PRINT " 16"
: 330 IF F=>146 AND F=<174 THEN PRINT " 15"
: 340 IF F=>416 AND F=<512 THEN PRINT " 14"
```

This section is for setting the switches to tell the 101 what bank your freq is in, and the manual says something different. For freqs in the 30-50 range, turn on switches 14 and 15; for 146-174 turn on 15 only; and for 416-512 turn on 14 only.

Switch 16 is for rescan delay, and is optional for any channel.

: this yet? It seems to me we could take care of this matter ourselves and
: have a nice generic AR8000 eeprom dump zip file floating around the net
: for all that are interested (read: cell freq mod for AR8000).

I have been reading on CompuServe this is true -

Anyone who buys a UK AR8000 and UK interface (from what I read) can upgrade
the US model to international standards and capability (read that as CELL MOD)
by cloning the US model from the UK model. This is why EDCO chose to not sell
the UK version of the interface with cloning.

But, the interface can be commercially imported and sold in quantity without
any problems from the feds - due to it (on its own) is NOT a scanner of four
or more frequencies. This means a smart enterprising company who is NOT in
the scanner business could set up doing the mods (re-cloning) without any
hassle from the government. Also since the interface is NOT an rf device,
it requires no FCC approvals nor can the FCC prevent its importation. It is
my understanding the upgrade from US to international standards can be done
without a computer, all you need is an international unit (UK) and the UK
version of the interface, the scanners do the rest.

Looks like they are very easily modifiable if what I have read is true.

I think its about time someone told EDCO - GET A LIFE! IMPORT THE UK
INTERFACE!! THERE IS NOTHING LEGALLY STOPPING YOU!

>a list of the frequencies which this scanner receives? Also, are there any
>mods which would extend that set? Thanks in advance!
>
>Steve

I'm still curious myself about mods (since I only bought it a week ago), but
here are the frequencies, as extracted from the op guide:

29.0 - 29.7 450 - 470
29.7 - 50.0 470 - 512
50.0 - 54.0 806 - 956
108 - 137
137 - 144
144 - 148
148 - 174
406 - 420
420 - 450

Obviously, there are some pretty big holes in there that would be nice to fill.
My manual also specifically states that the SportCat won't tune cellular freqs
(type one in, and an 'error' message appears. I don't know how long they've
been making them to exclude cellular, but my date code is OCID (whatever
that means).

Hope this helps a little.

Mike

Does anyone out there know of a good 138 MHz beam antenna? I need
circular polarization and 12-14 dB gain.

The objective is to find a way to build low cost receive-only ground
stations for the HETE (High Energy Transient Experiment) spacecraft,
which will be launched later this year. Selected data will be
sent down at at 137.96 MHz (the main downlink is S-band).

For those interested, HETE will transmit linear polarization, but
Faraday rotation will cause the plane to revolve rapidly. With a
circularly polarized receiving antenna (either left or right handed),
this rotation becomes a frequency shift, which is small compared
to the doppler shift and therefore not a problem. A linearly
polarized antenna, in contrast, will see severe fading, disrupting
the modulation.

It's probably best if you reply to me by e-mail, given that I'm
cross-posting this to four busy groups.

Thanks in advance.

John Doty
HETE Project Scientist

I've in advertently :] overheard local cops who carry their own cellulars
with them making personal phone calls while on duty. In one case, one was
having phone sex with his girlfriend/mistress. Interesant!

I just recieved a very very intersting piece of email from Germany.
There is an unusual function built into the AR8000 that requires
an option board.
The software for this is already in the system rom,
to make this board work.

what is this unique option?
Cell phone?
or something else -banned in the USA. (England ?)
See if you can guess by following up this message.
I will post the answwer Sun afternoon and put it on the AR8000
Home.page at that time.

I need to reread the message to see if I truely understand it
as it may be there is more then one type of add on option for the
AR8000 or this may be how a country handles a certain radio
service which would be different then ours.

But even if the later is true I can see an immediate use for this strange
option for a scanner radio.

I want one!

It is definitely illegal to pocess in the USA under current law :>(
darn!

This AR8000 is one hell of a radio!

Vic Healey
ki4je

PS The sender of that bit of information says that his unit
seems to have many birdies. Mine dosn't unless I
haven't looked in an area important to him.
Have you seen many undesirable birdies?
Comments?

Need more information for the world wide web's Ar8000 homepage,
What do you use the AR8000 for? Why?
need mirrors to spread the load out also.
73's

There is a way to get Cell, but it requires erasing all your channles in memory.
Basically it's the test mode:

TEST MODE 1. Fill channels 1-25 with test frequences.
- -
- - - - - - - -

Press the 2 key, the 9 key, the L/Out key, and turn on the scanner.

This fills channels 1-25 with these frquencies:

1 30.050
2 40.840
3 49.900
4 138.150
5 162.400
6 173.225
7 406.875
8 453.250
9 511.9125
10 108.500
11 118.800
12 127.175
13 135.500
14 66.450*
15 76.825*
16 87.425*
17 157.800
18 482.3625
19 29.000
20 54.000
21 806.000
22 857.200
23 888.96**
24 911.500
25 954.0125

*These channels weren't originally accessible
**Here's your Cell channel! Just search up or down, there are tons of phones here!

Once again THIS CLEARS ALL THE CHANNELS YOU HAVE IN MEMORY, so you should write them down first.

L8TER!

>unit in any of the News Groups I've seen...

The Radio Shack PRO-2035 has been reviewed in several magazines.
There's a lengthy article in Jan. 1995 Monitoring Times comparing
the PRO-2035 to the older PRO-2006. US Scanner News also carried
a long review.

Before buying a PRO-2035, consider the new 500 channel Uniden/Bearcat
BC9000XLT. Weak signals on the PRO-2035 I tested were
swamped by stronger stations transmitting up to 100 KHz away --
a problem not shared by the PRO-2006 or BC9000XLT.
This is the single biggest problem I saw in the PRO-2035.

The PRO-2035 Auto Store feature mindlessly stores the same
active frequencies over and over again. The BC9000XLT Auto
Store is much faster and smart enough so that it doesn't
store duplicate frequencies.

The BC9000XLT has smaller (i.e., easier to manage) memory banks,
and can be fitted with an optional CTCSS decoder. Alphanumeric
tags can be programmed for the first 250 channels. There are
10 priority channels vs. a single priority channel in the PRO-2035.

The PRO-2035 has 10 search banks compared with the single search
bank in the BC9000XLT.

Large, color coded keys and a big tuning knob help make the
BC9000XLT easier to use than the PRO-2035. Look for a full
BC9000XLT evaluation in a future issue of Monitoring Times.

Date code, man, it's all in the date code. If you have an 8A4 or
later, forget it. If you have a 7A4 or earlier, you're in the
ballpark...try 2+9+Band, then 2+9+l/o (hold down for a few secs), then
check channel 23.

Below are several lists I've compiled from various sources. Enjoy.
Berton Corson

Last Updated: November 1, 1994

Since there has been quite a few posts wanting this data, here is a
list of fast food frequencies that is listed in the November issue of
Monitoring Times. But be aware, the FCC isn't exactly issuing frequencies
to every fast food chain for their own use, and that any fast food
restaurant can buy whatever low powered FM transmitters / receivers
they need for their store at an electronics shop. Anyway, just stick
the below in one of your scanner's channel banks, and see what comes
up. All this talk about food is getting me hungry.

Gourmet Restaurant Frequencies
------------------------------ ----------------------------------

Arby's 30.84 31.00 154.57
457.55 479.25

McDonald's 35.12 67.775 70.245
71.105 154.49 154.58
461.0375 463.2875 466.0375
468.2875 469.5125

Hardee's 30.84 31.00 35.02
151.685 151.805 464.0125
469.0125

Kentucky Fried Chicken 31.00 170.305 457.5375
457.5875

Taco Bell 30.84 154.57 465.8875

Wendy's 33.16 33.40 154.515

Burger King 30.84 457.55 465.8875
467.775

Last Updated: December 1, 1994

In a frequency guide I have, I have listed below the
frequencies that are listed. I really haven't tried most of
these, so maybe you should try programming them all, and see
what you get. I do know, that they all aren't police frequencies,
but some may be for other uses, like for Engineering Service
dispatching a plumber to fix a leak.

Anyway, here's what I got. Sorry, I can't tell from this list,
what each frequency does, and where it broadcasts from. I do
suspect, though, that the VA Hospitals in the area, the police do
use some common frequencies:

Location Frequencies
Bell? 406.325, 409.325
(I know of no VA facilities in Bell, but it's listed as such)

Brentwood 406.325, 409.325, 168.525, 168.575
(168.525 & 168.575 may be some good bets for police frequencies)

Long Beach 155.34, 168.325, 168.525, 168.575
Long Beach 170.400, 171.387, 406.325, 409.325

Los Angeles 164.175, 164.500, 164.700, 168.525
Los Angeles 168.575, 169.300, 171.387, 406.325

Los Angeles 413.825, 417.600, 419.150,

Last Updated: November 15, 1994

THE RADIO SPECTRUM

This is an approximate look, to help in searching frequencies on a
scanner or shortwave radio. Just be aware, having the right frequency
may not be enough, in tuning to a certain frequency. The time of
day, atmospheric conditions, location, mode you're in (AM, SSB,
Narrowband FM, Wideband FM, etc.), and your equipment, are also equally
important. You'll find most transmissions are broadcasted in Narrow-
band FM. Some main exceptions are shortwave (AM & SSB), commercial AM
radio (AM), commercial FM radio (Wideband FM), television (Wideband FM),
citizens band radio (AM & SSB), aeronautical communications (mostly AM),
and some military VHF/UHF (Wideband FM). Most all scanners will pick a
default mode for you, depending on what frequency band you are in. But
many scanners also let you manually switch between modes (AM, FM, etc.)
and frequency search spacing (5 khz, 12.5 khz, etc.) if the default modes
are not correct. Happy Listening!!!

FREQUENCY USES/SERVICES
(in Megahertz unless
otherwise indicated)
--- ---

10 - 150 khz Military/government, submarine
(.01 - .15 MHz) communications.

150 - 535 khz Longwave Band, beacons, foreign broadcasts,
(.15 - .535 MHz) maritime.

535 - 1700 khz Your standard AM radio dial.
(.535 - 1.7 MHz)

1.7 - 30 Shortwave/High Frequency Band. Broadcasting,
two-way government, military and commercial
communications, amateur radio, CB radio (approx.
27 MHz), others.
Shortwave - Approx. Range Meter Band
1.8 - 2.0 160*
2.3 - 2.495 120
3.2 - 3.4 90
3.5 - 4.0 80*
3.9 - 4.0 75
4.75 - 5.06 60
5.9 - 6.2 49
7.0 - 7.3 40*
7.1 - 7.35 41
9.4 - 9.9 31
10.1 - 10.15 30*
11.6 - 12.1 25
13.57 - 13.87 22
14.0 - 14.35 20*
15.1 - 15.8 19
18.068 - 18.168 17*
17.48 - 17.9 16
18.9 - 19.02 15
21.0 - 21.45 15*
21.45 - 21.75 13
24.89 - 24.99 12*
25.6 - 26.1 11
28.0 - 29.7 10*
(In general, the lower shortwave frequencies
<higher meter band> are received better during
the night, while higher frequencies are re-
ceived better during the day. There are also
some amateur radio bands between many of these
shortwave bands(*). Consult a shortwave guide
for more detailed information.)

30 - 50 Very High Frequency Band. Government, business,
walkie-talkies. Also, cordless phones and
'baby monitors' found about 46 - 49 MHz.

50 - 54 Amateur radio 6 meter band.

54 - 72 TV Channels 2-4.
Channel 2 Audio (Wideband FM) 59.75
Channel 3 Audio (Wideband FM) 65.75
Channel 4 Audio (Wideband FM) 71.75

72 - 76 Manufacturing, remote control, eavesdropping
bugs, etc.

76 - 88 TV Channels 5-6.
Channel 5 Audio (Wideband FM) 81.75
Channel 6 Audio (Wideband FM) 87.75

88 - 108 Your standard FM radio dial.

108 - 136 Aeronautical communications (AM).

136 - 138 Satellites.

138 - 144 Military communications.

144 - 148 Amateur radio 2 meter band.

148 - 150.8 Military use.

150.8 - 174 Business, highway, law enforcement, government, weather, maritime.

174 - 216 TV Channels 7-13.
Channel 7 Audio (Wideband FM) 179.75
Channel 8 Audio (Wideband FM) 185.75
Channel 9 Audio (Wideband FM) 191.75
Channel 10 Audio (Wideband FM) 197.75
Channel 11 Audio (Wideband FM) 203.75
Channel 12 Audio (Wideband FM) 209.75
Channel 13 Audio (Wideband FM) 215.75

216 - 220 Maritime and aeronautical.

220 - 222 Land mobile communications.

222 - 225 Amateur radio.

225 - 400 Military aviation and space.

400 - 406 Military and government.

406 - 420 U.S. Government.

420 - 450 Amateur radio.

450 - 470 Ultra High Frequency Band. Business, industry, military, fire, government.

470 - 512 TV Channels 14-20, shared with law enforcement.

512 - 824 TV Channels 21-69.

824 - 849 Cellular telephones (receivers/handsets).

849 - 851 Aeronautical telephones (ground-based towers).

851 - 866 Business, public safety, trunked systems.

866 - 869 Public safety, law enforcement, trunked systems.

869 - 894 Cellular telephones (towers).
Note: Even though listening to cellular telephone calls is technically illegal in the United States, one will usually do better listening to calls on the tower frequencies,

as opposed to the handset frequencies. This is because most cellular phones transmit less than one-watt of output. So unless the cellular phone is very close to you, you will have much more luck scanning the more powerful towers, which transmit/receive for each cell site.

894 - 896 Aeronautical telephones (handsets). Note: In scanning airplane telephones, you will usually do better listening to the handset frequencies, instead of the tower frequencies, unless you are very near a ground transmitter. But, in any event, call traffic heard on handset frequencies (which are transmitted from a high-powered transmitter on the aircraft) you may hear nothing at all, or many conversations, de-pending on your location and time of day.

896 - 901 Private land mobil units.

902 - 928 Land mobile, amateur radio, personal communi-cation units, cordless telephones.

928 - 932 Radio paging.

935 - 940 Business radio.

941 - 944 Government and non-government fixed services.

944 - 952 Broadcasters' studio-to-transmitter links.

952 - 960 Private fixed services, paging.

960 - 1240 Aeronautical navigation.

1240 - 1300 Amateur radio.

1300 - 1350 Aeronautical navigation.

1350 - 1400 Radio location.

1400 - 1427 Radio astronomy.

1427 - 1429 Point-to-point, mobile, space.

1429 - 1660.5 Various satellite transmission uses.

1660.5 - 1668.4 Radio astronomy.

1668.4 - 1700 Meteorological aids.

1700 - 1850 Meteorological satellites, U.S. Government.

1850 - 1990 Fixed point-to-point, microwave.

1990 - 2110 Broadcast studio-to-transmitter links.

(end)

If you're gonna bitch about the law, you should at least know
what it says. The Federal definition of "scanner" is a receiver that
operates between 30 and 950 MHz and automatically samples at least
four memories or channels. Your cellular phone and spectrum analyzer
do not meet the test.

I'm fairly new here, but was wondering what impact use of these communication systems for data transmission would have on the desiarability of a particular technology.

I figure prepared people like us would want to use computers for a number of purposes and which data technologies would be most useful for the "Survivor-Net".

Has any one out there gotten a close first look at the new RS Pro 62. I was thinking about a second scanner and the Pro 62 is on sale for $219. I know the unit cannot be modified to get cellular, but it looks like it might be good 800Mhz police. Thanks in advance.

Bob Lee

1697. A useful BC-200 Manual Suggestion (was: Phone number for Uniden)

Newsgroup: rec.radio.scanner
Date: 1995-02-04 04:58:09 UTC
From: newton@druggist.gg.caltech.edu
Message-ID: <newton-0302952058090001@fig-ppp.caltech.edu>
Source record: 261755

Douglas Baker (dbak@elm.lle.rochester.edu) wrote:
> I am trieng to get ahold of a service manual for my BC200xlt.

Here's another idea: Go to radio shack (or call their 800 number)
and order their PRO-35 service manual. Seriously.

(Actually, order both, but ...):

Rationale: While the PRO-35 is *not* exactly the same as a BC-100 (as
some have stated), it is *very* close. But, if you own a later model
BC-[12]00, the PRO-35 manual will actually be closer(!) to what your
scanner really is like inside, especially for things like parts
(the Uniden manual does not even have at least 4 parts on my version
of the main board). The manual has far fewer errors than the Uniden
manual, is not an awful 367th generation photocopy (you can actually
follow the traces on the nicely done circuit board sketches, and
the alignment procedures may possibly even be better ordered and
described (But this is one area where the lack of 800 MHz would be
significant, and I cannot decide which would be best).

If you order from RS you'll probably get the manual in about half the
time that it takes to get the BC-[12]00 manual from Uniden (at least
that was my experience); it will (after you add in Uniden's shipping)
also be about (?) half as much. (The pro-35 manual, ordered two weeks
ago was $9.16 including shipping to the local RS) & came in 6 days.

I'll post a comprehensive list of errors/mods in the manuals when I
have more time, but whatever you do, don't believe any of the labels
on the "block diagram" in the Uniden manual. It qualifies as the
highest density of errors per unit space that i've ever seen in a
technical illustration.

Actually it depends on which law you're talking about. If you are using your service monitor or cellular phone to monitor calls that you are not a party to, or you do not work in the cellular industry and monitoring is part of your job, then your monitoring is indeed illegal under the ECPA of 1986. The ECPA regulates THE ACT OF LISTENING, **NOT** the equipment you do it with. In fact, the ECPA **NEVER** even uses the word "scanner". The word "cellular" is only used twice.

>Beyond this, I don't remember much, such as model name or designation, but
>maybe this will jog someone's memory.

That was an Electra/Bearcat CompuScan 2100, introduced in 1983.
There was no frequency display, just volume and squelch, so it *had*
to operate with a computer. It used a proprietary protocol
and a "canned" frequency management program. The initial units
worked with a slow Commodore 64 but Electra pledged future versions
for other computers -- a promised left unfulfilled by a Uniden
takeover.

The CompuScan 2100 had 200 channels in 10 banks, 3 priority channels,
and 4 auxiliary switches per channel. Like the BC-250, it had
Search & Store, as well a a Count function. You could keep a text
description of each channel. The radio "guts" were essentially the
same as a BC-300.

Collectors may be interested in reading the review in January 1984
Computers & Electronics magazine.

The CompuScan 2100 was one of the last scanner models offered for
sale before Electra sold out the Bearcat scanner line to Uniden.
If Bearcat scanners had remained part of Electra, an innovative
company based in Cumberland, Indiana, perhaps we would have seen
more computer controlled Bearcat models.

You can buy an uncensored one from Javiation. Call Jonathan at
011-44-274-732146. He stocks them and they only take 2 days to get here.
You won't have 30kHz steps, but can choose between the usual 5, 12.5
and 50kHz ones. For a power supply, a regular $11 RS 12v 500mA one will
do just fine hooked up to the Pro2035's DC jack.

First make sure your batteries are up to snuff.

Still a problem? Check the back of you manual and you will see
there are four items to tweak. One of these relates to stopping
PLL - Error's caused by trying to scan near the limits of the radio's
abilities.

You have to switch to these functions by semi arcane method of
holding certain keys while switicthing the power on.
They recommend three hands (fingers) but I notice that if you set the function
to sticky function key and then do the power sequence hitting function
immediately on power up you have time then to lesiurely press the other keys
to enter the required mode. Can be done by one hand.

I am curious as to where I can purchase an AOR8000 for a reasonably good price. I would appreciate the name/tel number of any mail order cataloges where it can be found. Since I am fairly new to this, I am curious as to what other supplies/accessories I would need for this scanner.
Email would be appreciated.
Thank you.

Hi, KO6EB:

The PROPER way to make a test transmission is to key the mike and say "This is KO6EB testing", and once you have the results you want, you then say "KO6EB clear"

There is NO EXCUSE for kerchunking a repeater for "fun". If you want to "kerchunk" things for "fun", go down to the CB band.

They'll LOVE you over there.

73's!

Usually in the 460-465mHz range; my own is 462.825mHz, but
they do use other ranges, though not as widely. I would
expect that 900mHz pager will be used soon.

: : I have - there is no exemption from identifying that I can find for "short
: : test transmissions". This type of transmission would be considered an
: : authorized one way transmission but still needs to be identified. If you
: : kerchunk in order to test your radio, that's fine - but you need to id IAW the
: : rules under which you are licensed.

: : The only exemption from normal IDing procedures is for telecommand of model
: : craft.

: : Curtis Wheeler San Ramon, CA (cgwh@chevron.com)
: : KD6ELA / GROL PG10-25691 / Pvt. Pilot ASEL

: It looks like KO6EB is a product of the VE testing system.
: If you can memorize the answers to some questions, you can get a license.
: At lease he knows what part of the CFR governs the service he uses.
: The VEs here do not even randomize the answers to the questions.

: In another few years the "virus" that has infested amateur radio (the KO6EBs)
: will render the hobby useless and the EIA will have it's way.
: Amateur radio will go the way of CB and the frequencies that we have left
: will be taken away and auctioned off to the highest bidder.
: As happened to 220 MHz and UPS.

: The Telephone Pioneers here have a 220 MHz system state wide.
: It went up shortly after Hugo hit.
: It does not take a rocket scientist to figure out why Ma Bell financed
: this system.
: Its much cheaper to finance a radio system in the ham bands than it is to
: buy the frequency and license it.
: In time of disaster the Pioneer 220 MHz system will most probably be used
: for commercial traffic.

: This is what the KO6EBs do for us.

: Glenn Little
: WB4UIV
: licensed 23 years

The population of new amateur radio operators has been declining since the 1970's. It must be an absolute priority of every ham that values his or her hobby to encourage and attract new younger people into the hobby. It seems that there are those that would rather hear static on their radios than allow novice no-code operators on the air. If hams continue with this elitest attitude then the hobby will die. In all endeavors there are the good operators and the bad apples. I have heard obscene things on 20 and 40 meters for years were the so called "good morse code hams are" and it makes me angry when they turn around and predict that no code will lead to CB-like conditions. The fact is that if there are no new hams to carry on the hobby then there WILL BE NO HOBBY PERIOD! And the commercial interests will get the entire spectrum. In my opinion morse code was not a "CB filter" it was a barrier to new hams. WAKE UP! Use the frequencies, OR LOSE THEM. It is that simple. Remember, it is just a hobby, have fun for goodness sake.

I canceled my earlier reply because it was wrong... SCA subcarriers
are FM, not AM. There may be as many of them as the licensee wants, but
the total modulation of the main carrier by the SCA's must be less than
30% for a mono station or 20% for a stereo station, and less than
10% for SCA's above [75, 90, I forget] kHz. All of the rules can be
found in a well stocked library that has the Code of Federal Regulations,
47 CFR 73, I think 73.319 or something near that.

>How can I erase stored frequencies from a Uniden Regency scanner.Model No.
>R4020.Thanks.
>
Greg, you might try what works on other Unidens--turn the radio off, hold down the 2,9, and Lockout keys and turn the radio back on as you hold those keys down.

AND I NEED HELP TOO: On my 200XLT, 2-9-L/O clears everything, but when I reprogram it, the first frequency I save is automatically stored in every channel. Anybody know how to overcome this?

I have a program which will do it. I'll post it to everyone
on the group as soon a I figure out how to uuencode. Maby someone
can help me find the internal audio mod to my BC200xlt.
The program only works for 8 bit mono and with a sampling rate
of 22KHz. This is no problem for most soundblasters which I have seen.
It's not that fast but works quite well.

1739. AR-8000 "EX" & [PASS] problems

Newsgroup: rec.radio.scanner
Date: 1995-02-05 03:42:29 UTC
From: bbbjamin@aol.com
Message-ID: <3h1hf5$bfc@newsbf02.news.aol.com>
Source record: 261847

AR-8000 "EX" & [PASS] problems

"EX" command
[PASS] Function

RE: "EX" Command for the AR-8000 interface won't work
I can not get the "EX" command to work. Example - While using different commands via [Computer ::Interface:: AR-8000] I can not get the "EX" command to function, the AR-8000 beeps like it excepted the command but I can not use the keyboard as the Manual explains, until I manually push [LOCAL] on the 8000 key pad.

What's the deal!!??

RE: [PASS] Function
Also while in limit search with the 8000 and using [PASS] function I have found a problem, Example: Setting up a search with starting freq. of 46.0 & ending freq. of 47.0 step value of 10K. This is the problem the manual notes (p-91) To prevent the same freq. using up many pass channels the 8000 will not permit the same freq. to be registered for PASS within a range of +/-10K from the previouse locked out freq. So if I want to PASS 46.7 but keep 46.6 & 46.8 I can't do it. So actually the 8000 is PASSING all three 46.6 / 46.7 / 46.8 this is a BUG unless I can disable the 10K spacing parameter. Can I reprogram the 10K to lets say 5K, or disable it completely??????

What command do I use to Dump of the 8000's EEPROM to my computer??

Please E-Mail BBJAMIN@aol.com
The 8000 is Nice but could be Nicer

Sorry, no. While there may be an illusion to being hooked up to a giant antenna array on a mountaintop, TV cable is a closed rf system, and the only thing that you can receive is what the cable company inputs into it.
It does sound like yet another cable channel to call and ask for, though<G>, "Call your cable company and ask for the Scanner Network!, 30 of America's biggest police departments, piped into your scanner! And, if you get the optional decoder box, hear the hottest 976 numbers, too!"

David, cable employee who has been reading too many marketing magazines....

Hi, Grady:

> Well I'm all for the Old Farts like WB4UIV teaching us young'uns
> how to really efficiently use amateur radio. How about staying on

Could've fooled me. Afterall, wasn't it YOU who advocated the idea that all you need to do to see if you're hitting a repeater is to simply key, and un-key the microphone(...like some no-ID bozo is doing right now on a local 440 Mhz. repeater)??????

> WB4UIV represents the worst, vicious tradition of amateur radio
> the tradition that shortly will make amateur radio worthless except
> for chopping up and auctioning off to hand held video games.

You don't look like you're any better. In fact, I'll say you are WORSE than Glenn seems to be. If the tradition of Ham Radio(....oh, excuse me, AMATEUR radio) is someday deemed worthless, it'll be because of idiotic morons such as YOU(...._NOT_ Glenn).

> WB4UIV should start innovating in the hobby rather than whining
> about their betters who point out that brass pounding is
> becoming suspiciously close to sand pounding.

Oh, brother!

W A K E U P A N D S M E L L T H E C O F F E E , G R A D Y !

If ANYBODY here in this group has an "I don't give a s**t" attitude, it's _YOU_!!!!! You haven't the FOGGIEST idea of what HAM(...I will call it that) Radio IS, do you????

I don't think so!

> : This is what the KO6EBs do for us.

You're darned right, Glenn. Grady IS the epitomy of HAM Radio's own WORST, PATHETIC example!!!!

QST! QST! QST! All stations be forewarned of GRADY WARD, KO6EBs Operating Practices(...not to mention PROCEEDURES)!!!!!

Tell me something, Grady! Which is more important to you in the wake of an earthquake in your area? A): Helping your local ARES or RACES group with NECCESSARY communications on HF, or B): Grabbing that last DXCC Country, while "your" comrades are working their butts off just trying to keep reliable communications going in the same disaster?????

Humor me!

37's for now!

1746. Is RS Pro-39 dated 11A3 Mod-able, RS wants $219, Fair Price?

Newsgroup: rec.radio.scanner
Date: 1995-02-05 06:37:46 UTC
From: donwood@aol.com
Message-ID: <3h1rnq$do8@newsbf02.news.aol.com>
Source record: 261854

Radio Shack having discontinued the Pro-39 has put them on $219 until gone pricing. Is this a fair price? It seems roughly comparable to the 51/62 class machines but unlike the 62 has full air band. The 62 is on sale for the same price (during April) and has triple conversion but I want to retain the option of modifying it for full 800 Mhz should the mood take me. ;-)

Is a Pro-39 of this vintage modifible? The dealer has about 15 in stock. Is there any previous date number that might make it worth looking through all of them to find?

I've have a Pro-39 800 Mhz mod posted here earlier but it doesn't mention versions. Perhaps version dating is only necessary on other models and all 39s are modable...but before I buy one I thought I'd ask.

Exactly and the best thing you can do is go out and buy some crappy cheap
headphones that you wouldnt buy to listen to music unless you REALLY had to..
They wont have the Freq Range that High Fidelity music has but are just right
for listening on the scanner..

JIM NUGW64A@prodigy.com asks:

Is there any DEFERENCE in the interfaces between the UK version and US
> version ?

I suppose I could make some cheap remark about the US still being
deferential to the old colonial power, but I suspect the answer you want
is as follows:

1 The UK interface permits direct cloning between two AR8000
without the need for a PC to hold the data in an intermediate stage

2 The UK interface is 3-wire only which slows down the transfer
rate

The telephone system has the technical capability to flag a phone number
as non-billing. They could have a unlisted nonbilling number that they
can call from a pay phone (wouldn't require dropping 20 cents - just
lift the handset and dial). I know of several local numbers here that
are non-billing. They could also have an 800- number.

> but what about the receiver?
>
Having played around extensively with both, I would go for the MVT7100 every time. -- The VHF/UHF performance of both is good and the SW performance marginal like all scanners, but the Yupiteru is very much more user friendly. A good test of any scanner is -can you use most of its' features without ever reading the manual. If you can, it is sensibly simple. The MVT7100 passes this test easily. The AOR doesn't.

The Yupiteru also has the performance edge over the AOR, even though it is considerably cheaper here.

Yupiteru manufacturing quality is excellent. AOR is not always so.

In Europe, the MVT7100 outsells the AR8000 by a factor of 10 or so.

Victor Healey Ki4je (vhealey@crl.com) wrote:
: Jim Dantin (mailto: jadantin@ndlc.occ.uky.edu) has posted an
: improved version of Steve Siegel's AR8000 Access database to
: ftp://ftp.crl.com/users/ro/vhealey/www/ar8000-1.zip .

I'm currently working on the -2 version. Most of my efforts have been
focused on getting the data from the AR8000 into the frequency database.

I need some opinions:

In version -2, you still have to use a terminal program to communicate
with the AR8000. Once you get a "MX" formatted text file, you can import
it into the database.

Here's the question:

Once you do your first dump from the AR8000, and import it into the
database, are you going to be importing a lot more frequencies, or just a
few that you have manually keyed in or located through searching?

I'm trying to decide on the approach to take - do I design for easy
capturing of a few frequencies, or do I need an elaborate scheme to
"syncronize" the database with the radio. Right now, it's a whole lot
easier to manage the frequency and channel assignments in the computer,
clear out the AR8000's memory, and reload it with a fresh set than trying
to keep the two in sync.

I really need your ideas and import (is anyone actually interested in the
project??)

Mike;
CTCSS stands for continuous tone coded squelch system. It is also
known as "subaudible tone" and "PL" by those who have been around a
while. It is a low freq (60-250 Hz) tone which is placed on the
transmitted signal continuously--you can't hear it, but a radio with
a CTCSS decoder can tell if a particular tone is there. It can be used
with a digital sqelch--only signals with the appropriate tone will
break the receiver squelch, or to limit access to the input of a repeater
to those stations with the right CTCSS tone (useful in areas where there
is some overlap of repeater coverage...

DTMF is dual-tone multifrequency. It is the standard 2-tone touch-tone
the phone system uses.

>AND I NEED HELP TOO: On my 200XLT, 2-9-L/O clears everything, but when I
>reprogram it, the first frequency I save is automatically stored in every
>channel. Anybody know how to overcome this?
>
Try holding down the MANUAL, 2, and 9 keys and switch the radio on. It
works on my BC200XLT and on my BC220 XLT. If you hold down the SCAN 2,
and 9 and power up it will enter the factory test frequencys into the radio.

Here in Charlotte they seem to have some kind of cell phone that works on the police freqs. You can hear them on several freq always the same ones they are not cell phone freq. Most of the calls are personal to wives etc and deadly boring.... One thing that is very strange is when the call is first made you hear both sides of the conversation then the cop's side slowly fades out untill you only hear one side (wife). When I first heard the phone calls I could not figure out why I was getting cell phone calls on a blocked scanner and why they were always women!!!
The cop's will often have someone call them on the land line for security reasons. sometimes you will hear one ask to call him on the cell phone or use conference which is not the same as using the phone...

1769. Problems with interference, Help Needed

Newsgroup: rec.radio.scanner

Source record: 261628

Hello,

I live in the San Gabriel Valley of Southern California. I have a Bearcat BC 200 XLT handheld scanner. Whenever I try to monitor frequencies in the 400 Mhz spectrum, and especially the 480 Mhz area I am overwhelmed with interference. The interference includes paging tones and unknown commercial radio traffic.

This problem is most acute when I am in my home. I do live near (within 2 blocks) some high power lines and transformers. I have solved the problem to a large extent by making and using 1/8 wave antenna for 480 Mhz. However, that solution is far from satisfactory for several obvious reasons.

The problem may be largely due to the poor dynamic range of the BC 200 XLT and the heavy RF in my area. When I tune my TH-77A 70CM HAM HT to the same freqs I don't get any interference.

I am considering purchasing a base model scanner with a better dynamic range than the 200 XLT. Would this solve the problem? And if so, which models should I consider? I would like to keep the cost under $400 (preferably under $200) and I really don't need 800 Mhz, or over 100 channels.

I also have heard that notch filters might solve the problems. What would such a solution entail?

Thanks for the help in advance.

>thanks,
>Ken

I've done a side-by-side comparison of the ar8000 and the mvt7100
(same antenna on both).

I find the Yupi to be slightly more sensitive. And, it seems to
be less prone to fading signal dropouts. However, the difference is
not much.

Compared to the Yupiteru, the one thing I don't like about the AOR
has to do with esthetics. The Yupi has a more solid feel (I hate
the loose fitting AOR knobs), a much nicer vinyl case, and more even
keyboard/display lighting. Of course, the AOR does have more features
on its side...

>to specify that the Automatic (Step & Mode) bandplan feature was off?

The reason this scanner rejected your frequencies is that you overlooked the
requirement that the frequency must be divisable by step size. Ie the step size must
be a factor of the desired frequency. Do the math on what you tried and see if
I am not correct.

RB> -= Rich =-

The 10A3 Pro-46 you have is, at the least, modifiable for the
cellular frequencies (via the keyboard 2,9,L/O,switch on method).
However, I don't know about the military aircraft frequencies.
If you find out that it is, let me know, as I would be interested in
that modification also.

Can anyone help me with the appropriate police UHF channel number for the following areas of GOLD COAST, QUEENSLAND AUSTRALIA.

What channel number would I use (from 64 UHF police freqs) if I were if following area: (Such as channel 36 for Beenleigh)

- COOLANGATTA

- BROADBEACH

- SURFERS PARADISE

- SOUTHPORT

- BEENLEIGH

- WOODRIDGE

- HINTERLAND

- COOMERA

- BRISBANE CITY

- AND WHAT CHANNELS FOR NORTH, EAST, SOUTH, WEST METRO BRISBANE AREAS

Many thanks as I am holidaying there very soon and would like to know what channels to listen to for each area. (I already have 64 freqs so dont worry about sending them.....just channel number)

PLEASE EMAIL ME!!!

Matthew
matthew@adelaide.DIALix.oz.au

PS For those of you who are reading this in aus.aviation I apologise for posting it there but I am desperate for the info quickly and I thought that there must be some scanner users in aus.aviation that also listen to police that may be able to help me

I suppose I could make some cheap remark about the US still being deferential to the old colonial power, but I suspect the answer you want is as follows:

1 The UK interface permits direct cloning between two AR8000 without the need for a PC to hold the data in an intermediate stage

2 The UK interface is 3-wire only which slows down the transfer rate

Could you be more specific about the slowdown? Why is the transfer slower? Assumming the PC or the AOR needed to pause transmission, does it use the extra wire for flow control?

>Press the 2 key, the 9 key, the L/Out key, and turn on the scanner.
>
Thanks, Mr. Mojo. But I couldn't get this to work on my Pro-46. I have a
newly purchased Pro-46 with a date code of 5A4.

Here's what I do:

I have the thing in my hand, turned off. I push the "2" key, then I push
the "9" key, then I push the "L/Out" key. Then I turn the thing on.

What it does:

It starts scanning as if nothing different was going on.

Did I make a mistake? Has the test code changed? (I have the shop manual
on order from RS, maybe I'll get the info there?)

What's a RS-46 owner to do? I'm bored by my cordles neighbors and I want
to check out the cell bands.

Can anyone give me a clue?

Thanks,

Mikek

1790. Help with a few Questions please

Newsgroup: rec.radio.scanner
Date: 1995-02-06 06:26:16 UTC
From: Marcum@nance.demon.co.uk
Message-ID: <224886865wnr@nance.demon.co.uk>
Source record: 261645

I am a U.S. citizen living in Britain. I'm a bit out of touch with the
U.S. Scanner market so I have a few questions. Any help would be appreciated

1) what other scanners are there like the Yupiteru MVT-7100?
I understand that this unit can receive from 100kHz to 1650MHz
Does AM, FM, WBFM, NBFM, and True SSB, is portable,1000 channels.
Are ther others that can do the same? are their problems with the
Yupiteru MVT-7100 or the others that I should know about?

2)What is the U.S. price for the Yupiteru MVT-7100 or
one of the other units that is like it (see
question 1). Are the non blocked (cellular band) still available?

3) Can someone give me the location and phone number for
Scanner world? (I need the regular toll number since the
Toll free 1800 number can't be dialed from Britain.)

4) Are there other "Scanner retailers" like scanner world? What are
their name locations and phone numbers?

I realize the questions are very general but I'll be coming back to the
U.S. soon and I want to buy a "super capable" scanner like the Yupiteru MVT-7100
If I can still find a non blocked unit at a U.S. outlet I'll buy it by
phone and have it shipped to a relative in the U.S. other wise I'll consider buying
one while I'm here and bringing it home with me.

Reply to the group or by E-Mail.

Thanks in advance.

1795. Where to get RadioMap ?

Newsgroup: rec.radio.scanner
Date: 1995-02-06 12:25:35 UTC
From: casato_jc@atc.alcoa.com
Message-ID: <casato_jc-060295072135@132.226.103.46>
Source record: 261650

I've received several inquiries about where I got my RadioMap.
My source was Bob Parnass. I'm sure once he sees this posting he will post
the necessary details, etc.
Thanks for the interest in the RadioMap ... I don't think you'll be
disappointed in Bob's product.
Happy Scanning....Joe C.

In a previous article, kerhop@eskimo.com (Billy Laughlin) says:

>it has already been answered for television cable, so what about hooking
>up the ground in the house to a scanner's antenna? I'm always seeing
>little devices that you can plug into the wall that claims to use
>the electrical wires to pick up television better (as a huge antenna I
>guess) so could the same be done for scanners?
>
>
It's my understanding the "turn your house wiring into a TV antenna"
gizmos are totally worthless. Anyway, the higher the frequency the
shorter the antenna, so scanning high frequencies requires a short
antenna, and the total length of your house wiring would not be a good
match. An extended longwire antenna is great for the shortwave bands,
but lousy for scanners.

> does it use the extra wire for flow control?

No, the US interface uses a separate wire for squelch sense. For certain remote control operations, this makes for a faster interface; for other operations, it doesn't matter at all. The AR8000 has a number of commands that tell the radio to do something, and to just notify the control program when something happens (like the radio stops on an in use channel). For these functions, the separate squelch sense wire doesn't buy anything.

Still, having squelch sense on the DTR line is a nice thing, but then again, so is the UK interface...

>on its side...

I own the Yupi and went to Tucker Electronics to play around with the AR8000. I noticed the loose knobs and the operation of the unit was very hard to understand, initially. One thing I noticed about the AR8000 was that the signal strength bargraph jumped around with the modulation level. On the Yupi, it is solid and accurate.

>Happy Scanning....Joe C.

Forgive me if you've seen this before. From the rec.radio.scanner
FAQ article:

Over 15% of the FCC licenses, including many fast food
restaurants, contain transmitter latitude and longitude but
specify no transmitter city. To determine the location of
those transmitters requires using the latitude and
longitude information.

As I have already done for dozens of radio enthusiasts and
companies in several states, I will locate FCC licensed and
selected FAA transmitter sites in an area of your choice,
and produce a custom report. To make it easy to locate
transmitters, the report includes a color map marked with
transmitter sites. I call this new innovation RadioMap(TM)
service. It allows you to identify antenna sites
(including paging and cellular phone cell sites) and
visualize the transmitter locations in your neighborhood,
near your office, at an airport, and other places of
interest -- from VLF through microwave.

This is completely different from, and independent of the
Grove Enterprises CDROM. See Feb. 1995 Monitoring Times
page 101, or RadioMap reviews on page 2 Feb. 1995 RCMA
Scanner Journal and page 36 Jan. 1995 AOSC's American
Scannergram.

Ham radio stations are not listed. The RadioMap report
includes frequencies, callsigns, and licensee names. I
will choose the range, depending on transmitter site
density. In rural areas, ranges of up to 8 or more miles
are possible, while ranges of 1/2 to 3 miles produce best
results in urban cities.

I will produce custom RadioMap reports for areas in any of
the 50 states. Send $19.95 for each RadioMap report, your

name, address, and telephone number, along with center
location (nearest intersection of 2 streets, or latitude &
longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL
60543. tel. 708-554-3839 6-10 PM central time.

In a previous posting, JWW (hiyall@vnet.net) writes:
> Here in Charlotte they seem to have some kind of cell phone that works on
> the police freqs. You can hear them on several freq always the same ones

It's called a phone patch. It was very common before the cell phone showed up. Hams use them, as do a lot of other radio user, such as contractors etc. Here in town the newspaper photogs have a Handheld two-way radio with a phone keypad, so they can make phone calls re: assignments. The system works unless someone forgets to hang-up the repeater! Downside is it is not private! Ya! I know you can monitor cell calls, but it is hard to monitor I cell phone. The phone patches are always the same frequencies, so if you were listening to XYZ on 163.7400 tommorrow you know you would still find them there.

No, it will be replaced.

Not every "young novice ham" is a young novice ham. When I went back to graduate school, I thought very hard about directing my research towards communications. From my previous college experience, an *advanced* license would have only required a little add'l study, and that would have been the regulations. I already knew 95% of the technical material in the study guide.

But I looked around the ham groups, and decided there was no way I was going to support such arrogant airheads. This attitude of "I don't care *what* he knows if he can't do morse at 5 wpm" was obscene.

I figure in a few more years the time will be ripe for a bunch of us to approach the FCC and ask for a chunk of the ham spectrum for a new ham service. One where morse code is optional, but just to keep the riff-raff out you'll be required to write a relational database in TI-82 code in 20 minutes. :-)

Seriously, a reasonable question would be to "contrast and compare Limpel-Ziv and Huffman compression techniques."

Considering the qualifications we'll be able to present (MS's and PhD's in EE, CS, communications, etc.) vs the so-called qualifications of the advanced ham communitity, our research focus vs. the public forum for bitching about these no-code licenses, etc., I think there's a good chance the FCC will agree.

>And the commercial
>interests will get the entire spectrum.

Not necessarily. But the "new ham" service will probably be very unfriendly towards the existing ham service because we all have bitter memories about their elitist attitudes.

I think being able to do 5WPM sending ASCII with 8 toggle switches and a pushbutton is a better start. (I did that once back in college when we had to build the sending side of a UART with TTL chips... it freaked out everyone who was watching.) And don't forget the rest of the Hacker Olympics events, like refolding an entire box of fanfold paper!

:) :) :)

Have you made this modification to a Pro-2032, Gary? Is it electrically identical to the mod given in Monitoring Times? If not, are there any differences in performance relative to the MT mod?

I just want to be sure this mod works and does not affect performance outside of the cellular band since cutting circuit traces is not easily reversible (or would a drop of solder on top of the cut trace repair the connection?).

1816. Bearcat 200 XLT susceptible to interference

Newsgroup: rec.radio.scanner
Date: 1995-02-06 20:32:39 UTC
From: jdjustin@netcom.com
Message-ID: <jdjustinD3LIEG.CFD@netcom.com>
Source record: 261667

I am wondering whether those using the BC 200 XLT have noted greater interference with that unit than with other scanners. I have noted a great deal more interference with this unit than I did with my old 16 channel programable Bearcat scanner. This interference is most pronounced in the 480 Mhz range. I do live in Southern California which is particularly RF crowded.

In addition, I would like to attach my scanner to an external antenna. Whenever I have attempted this with my 200 XLT it becomes overloaded with garbage. I am wondering whether anyone can share with me successful scanner/antenna combinations.

Thanks,

Justin

I successfully modified my BC 855XLT. It now gets 100 channels
instead of 50, and continuous coverage of 800mhz. The only problem
is that it doesn't seem to step the right increments for cellular. I
wonder if there is a solution?

I have had the same problems with my 200xlt, especially in the VHF-high area (my local PD is located at 155.700). Since I live near a small airport, I frequently hear an image of the local tower and planes taking off and landing which, as you might imagine, gets rather annoying. My old Radio Shack Pro-43 never had this problem.

The gp-300 is a UHF 4 Watt radio. The P94ypc is the clue,if it were a P93XXX
it would be VHF. The radio comes in several ranges and the rest of the number
gives you that info. However I don't have that but if my memory is correct
that model should be the 465-495 range. The other ranges are
403-433,438-470,and 490-520. Hope that helps some,good luck...Terry

1840. I tried the Pro-46 mod

Newsgroup: rec.radio.scanner
Date: 1995-02-07 06:01:39 UTC
From: Mikek@world.std.com
Message-ID: <D3M8qr.5s0@world.std.com>
Source record: 261690

I nabbed the Pro-46 mod from oak.oakland.edu. It seemed to be kind of old, having been written in 1993. My scanner is pretty new, and has a date code of 5A4.

The mod seems to have failed. But at least my scanner seems to work OK. It was pretty hair-raising to be fucking with my radio like this, but overall it went pretty smooth. Despite not working.

Iwonder if anyone knows if the mod is good on my scanner. The keypad mod (2+9+L/out and power up) doesn't work, either.

One thing I noticed about the diagram in the mod file:

The pad indicated for placement of the jumper has a blue wire leading out of it and up to a small bank of wires placed just above the CPU. The mod diagram doesn't refer to the wire at all. Did I read the diagram wrong or has the radio changed since then or is the diagram just missing areferenc to the wire? Right now, the jumper goes from the pad with the wire , over one trace to it's left, and is mounted on the next pad over. If you've tried it, you know what I mean.

Anyone have a clue about this?

Oh, and what exactly does the little board labelled 800 Mhz unit do?

Thanks,

Mikek

You can now get the triple conversion PRO-62 at Radio Shack for $219.00.
A far better scanner than the 200xlt, RF-wise. The 200xlt is better
mechanically, however. (I realize the PRO-62 will not get cellular.)

>
> I just want to be sure this mod works and does not affect performance outside
> of the cellular band since cutting circuit traces is not easily reversible
> (or would a drop of solder on top of the cut trace repair the connection?).

I have performed the revised mod on exactly one Pro2032.
It has been running for several days now without mishap. I did
NOT run out and purchase a second Pro2032 in order to perform
double-blind regression tests of the old versus new mod.

I did however, weigh the risk of wading into the board with my
trusty iron, possibly heat-damaging a component or having that
new over-sized diode short out against the heat shield.
(Insulating tape always comes unstuck eventually)

My risk/benefit analysis said to go with the mod that I posted.
The trace to be cut goes only to the diode that is removed in the
original mod. Therefore, if you ultimately find that it produces
unsatisfactory performance, you have two fallback plans:

1. perform the mod as published in Monitoring Times
(yank the old diode and solder in the new diode)

OR

2. re-connect the trace using a drop of solder or
a short piece of some other conductor.

So there you have it, a 'tested' mod with two fallback plans.
<standard disclaimer applies>

Now if I could just figure out how to get this Pro2032 to
pick up cosmic radiation...Ooops, wrong news group. :-()

I think Wally may be trolling, but hey...I'll bite!

It's refreshing to find a group of people helping each other
to overcome the repressive US scanner law. Ultimately, RS and other
manufacturers will get their bugs ironed out and cellular
mods will not be feasible. Too bad. Then Wally will be able to enjoy
a better S/N ratio.

One man's signal is another man's noise. (sorry ladies)

1848. Freqs. for Motorola GP-300 radios?

Newsgroup: rec.radio.scanner
Date: 1995-02-07 12:18:58 UTC
From: chris.o'hearn@doghous.com
Message-ID: <307.218.477@doghous.com>
Source record: 261578

: I have been trying to determine what frequencies are being used by
: security in my office building. I asked a security person today and
: she replied that she didn't know the frequencies but that she
: sometimes hears transmissions from the building across the street.

: The radio she was using was a Motorola GP-300. It had about a 6"
: antenna that was 1/2" thick.

: Does anyone know what frequencies are used by this model unit?

First, hello from a fellow listener in La Crosse, WI, here's what I
could find for you:

The Motorola Radius Line (Inc. GP Series) covers the following bands:

VHF 136-162
VHF 146-174
UHF 403-433
UHF 438-470
UHF 465-495
UHF 490-520

The 300's are usually 8 channels, VHF 5 watts, UHF 4, so it is very
likely that she would hear things from across the street, perhaps even
across the city, and hearing other users would sound like perhaps a
community repeater. Have you checked into the size of the security
company (i.e. do they operate in just your building, or are they all
over the city/state).

The antennas sound like the 136-162 band, while this covers anything
from HAM to Govt, the business bands would be your best bet (about
150-154)
Another thing that I could suggest to narrow down the search, is to
find a friendly security person who would let you open up their radio.
The clips are on the side, flip them so the little orange spot is
showing, then take the battery pack out, and the list of frequencies
should be listed. These aren't always accurate, but should get you
where you're going. (The units run about $750 so be careful!). The
other thing you could do is check with your local Rat Shack, and see if
they have any lists (beware, the list here had a lot of errors) that they
would let you have a copy of, or maybe their latest attempt at a freq.
book (Beyond Police Call) would have what you're looking for, if the
security company is big enough. Good luck with your hunting, sorry I
couldn't be of more help, but maybe this will give you a lead in your
search.

Happy Scanning,
-Chris

If all goes well, the March 1995 (next) issue of Monitoring Times
will contain a detailed review of the BC9000XLT.

Tom Swisher reviewed the BC9000XLT in the latest NatScan.

Sorry, I don't know about street prices.

I bought the new portable BC-3000XLT from The Ham Station (Evansville,
IN) which seemed to have the lowest price. I don't know if they
have any BC9000XLTs yet, but the phone number is 800-729-4373.

>I have had the same problems with my 200xlt, especially in the VHF-high
My old Radio Shack Pro-43 never had this problem.
>
>
But remember, the triple-conversion Pro-43 retails at nearly double the
price of the 200XLT. Why'd you dump the Pro-43?

They did a long time ago. The MR-8100 mobile scanner had a computer interface.

Hello from London!

I have a ton of listings at home that I'll try and dig up. I'm sure that a
lot of them should be for the K-W area.

1856. Poughkeepsie, NY freqs

Newsgroup: rec.radio.scanner
Date: 1995-02-07 14:55:53 UTC
From: jocatch@vnet.ibm.com
Message-ID: <3h81lpINNe5q@afshub.boulder.ibm.com>
Source record: 261611

I have database of about 1000 freqs. Not all of them are Poughkeepsie (some are nation wide). The problem is I can't answer any requests at work and I do no know how to send them via EMAIL via my Compuserve account. If anyone knows how, let me know. My Compuserve internet ID is 71161.2442 @ compuserve.com. BTW, the Poughkeepsie police, highway and a couple of others have gone to 800 trunk. My list has those freqs. If interested in those freqs, send me a note to the Compuserve ID above.

Joe Cacciatore

1857. Best MOBILE triple conversion scanner??

Newsgroup: rec.radio.scanner
Date: 1995-02-07 15:29:54 UTC
From: kevin.jessup@mail.mei.com
Message-ID: <kevin.jessup.319.05329530@mail.mei.com>
Source record: 261526

I looked at the new Uniden mobiles (the 350 and the 700)
at Amateur Electronic Supply here in Milwaukee over
noon hour today. Not that great. Many images and
birdies.

The new Radio Shack base/mobiles seem to perform better
but are too big and oxy for a car.

So what's a good mobile unit that isn't the size of
a concrete block and has triple conversion?

Vic,

Your such a tease...

Keep up the good work with the home page. The more I read about it the more I want one.

Simon
